As others have said, "use a marine antenna".This is a antenna that does not require a ground plane. Antennas like these are generally used on campers or boats or anything that can not supply a substantial area of sheet metal. The sheet metal is what make the ground plane on most vehicles. When the vehicle is made of fiberglass this cannot be done adequately.

P.S. The marine antennas are also termed a half wave antenna.
I believe Firstik carries them. Look for "no ground plane"
at this link.

Hi all:

I still have several pages covering CB's, including manuals, tuneup info, and much more. Please, visit the following:

http://home.att.net/~j.dow-kb2tlb/home.html/mypage.html

there you will find several links to your interest.

Tnx,
Jim/kb2tlb

I just bought an Xterminator II SP2000, with double coils, and I'm really amazed by its performance. It beats my 5' Firestik II, Wilson 2000, 102" whip and Anttron 1700!!! I was wondering if anyone else is using an Xterminator and could tell me if there is anything that I need to watch out for, like water getting in it (I spayed it down with silicon,) rusting, or icing problems in the winter. Thanks.

Toll, What are the laws of physics regarding volts and harmonics? I cant
argue against what i have seen, this same question was posed to dave
sometime ago so an amp was tuned at 20 volts and also one tuned at 15
volts, if i am not mistaken amp was made to do the same watts with of
course less drive applied at 20 volts, the one at 20 volts showed no more,
or even perhaps less harmonics than at 15 volts on a HP spec Analyzer. I
would like to see what the Motorola book says also.
I have an open mind.

None of your business!

What would the point of me naming people who operate illegally be on a public forum.

If you are too stupid to realize, or foolish, or whatever the case may be, that people on the ham, as well as Cb bands run illegal (or even legal QRO), then that is your fault.

I am sorry, but none of the people that I know would really appreciate me telling the world who they are?

Would your cocaine dealer like it if you posted his name?

Doubtful.

I need the following Sam's photofacts for CB to finish my collection:
249, 251, 258, 261, 262, 276, 288, 290 and 291.
If you have a spare one of these manuals or just want to get rid of the one you have please email me at buzzards@idt.net and I will talk price with you.
Thanks a bunch guys.

Hello Toll Free: Good posting, the subject of volting needs to be further discussed here. A lot of people don't have the inside poop on volting.

Doesn't Dave Made sell a external voltage regulator that can be adjusted for different voltages. How does that work? Is that regulator just for a separate alternator?

I asked Sean a while back, about a special regulator that would allow a normal
14 volts for the vehicles battery and a separate higher voltage for a amp. I
put a new 150 amp alternator in my truck, from Wangner, but haven't done
anything else with it. Is there a external regulator that is more better?

Jay in the Mojave.

Go to Shakespeare's website. Their the ones who make marine CB
antenna's. Using a normal CB on a boat with a marine antenna will not
burn up the CB the other guy said.

You ignorant bastard.

What the *&^& does a phone patch have to do with you connecting your
computer to a TNC to transmit packets of computer data over radio.

I really do wish that you would quit posting, because so far, most anything
you have posted has been wrong, at the minimum!

You, Pee Wee, have no idea of the reality of the world, no idea what you
talk about, and have little, if any, working knowlege of radio! Although,

you self proclaim yourself an "Old Timer", and love to brag about your "CB Radio History".

Newsflash, Pee Wee... Nobody gives a shit! And the rest of the world would ask that you please stop sending out the wrong information.

To those whom I offended, sorry. I am really tired of this guy.... For the second time.

And that is my 10-4, Pee Wee. Hope you don't have to get a 10-5 while I tell you to go 10-7.

Get it now??? Maybe if I drop myself to the level of "CB Radio infatuated idiot who has no idea of what happens in the real world", you might get it!

Just make sure what type of ground your boat is using, either positive
or negative.

Just got a new Galaxy Dx44V in ... the RF Gain Potentiometer doesn't
work... anyone got a new one of these with the same problem?.. also
the talkback is on all the time on... any info on putting in a switch
to shut this off and on would be helpful.

Your CB radio does not have to be "Marine Rated".

That is BS.

I would tend to lean at you do not have enough ground plane.  Or, you are
using a smallish antenna.

A little more information would be helpful.

Send it back to Galaxy.

Or to the place where you bought it.

Neither of the problems you are talking about are supposed to be happening.

Hey, It wasn't MY idea to name these guys--it was your idea--see below
in your own words. You argue that you know alot of hams who are using
illegal power, and you can name them, but when pressed, you skirt the
issue by wanting to maintain privacy. You and I both know it is a load
and you don't know ANYONE. If you did, you would follow through with
what you said. You just show that you are two-faced, Toll. Sorry to be
harsh, but I suspect you know one old geek somewhere who has an old
Henry capable of 3K and you extrapolate that EVERYONE has a Henry. Just
isn't the case. If you can name one amateur using illegal power, I can
come up with 300 who aren't. Get back to CB and forget this-it's off
topic.

Dave, X-Force, and a number of others make voltage regulators that you can put on a radio.

I have seen most of them, and they all look pretty much the same.

My advice is to find a GOOD alternator shop and ask them for the prices on a good Transpo Electronics regulator. I am using one for each one of my alternators (3 for the radio station), and have had good luck with them.

I run the blue ones (model number escapes me), and the are OEM Pheonix Gold.

The Pheonix Gold label on them runs the price up nearly another hundred
dollars.

Hope this helps!

You are right on one thing.

It is off topic.

On most all of the other rubbish, you are off... Like usual.

I see that you still didn't name your cocaine dealer, either.

Oh well.

Also, I said that I can name names of people using illegal power. I never said that I would. So, your offense (or, put in even better English, you'r offensive!!!) is total bullshit. You quoted where I said I could name names. I never said that I would, if asked, or as you so eloquently put it, if I was pushed.

You are falling on the same lines as Joe, the asshole.

Nice company you are starting to keep.

Have a nice day. Especially in your own little world!

Toll Free

Feeding 1 antenna with a 1/4 wave spacing produces a broad lobe with a slight amount of gain a a sharp null toward the parasitic element.

With the spacing at 1/2 wave there is a figure 8 pattern with the nulls broadside to the array.slight gain on the lobes.

3/4 wave and the pattern is triangular,3 nulls,3 lobes.

If you feed both antennas the pattern still varies with spacing and also with phasing,90" out of phase,180" out of phase etc.

Literally the possibilities are endless,even on a car.

That's fine - except you don't have to buy one if you already have a mobile
antenna. The bars can be had for $5. You can make a dipole for even less.

Tnom,

You bring up a very good point. I've always preferred "normal" speaking English, to any form of "lingo", whether it be truckers, "Q" codes, "10" codes, or stupid ham lingo ("we're destinated", "Hi hi", and my personal favorite, "fine business").

To me, it's the height of hypocrisy to bust on someone for using 10-codes or trucker's slang, and then use inappropriate "Q" codes, or worse, the ham that bashes CBers for using lingo, as he's fine businessing all the way towards being "destinated".

SSB operators, like I've pointed out before, seem to run somewhere in between the 2 extremes of either trying to sound "professional" (complete with a complete, if inappropriate "Q" code vocabulary), to being completely laid-back, with nothing but regular English to communicate with. I much prefer the laid-back groups. You don't get any gold stars for knowing the most codes....

That's not to say that codes do not have their place. They were designed to shorten transmission time, for necessary traffic. They aren't really needed on CB, during casual conversations, and IMHO sound a bit silly.

Dave

Cellular bands are another animal, covered by the communications privacy act. But there are no provisions that ham radios must not transmit out of band. The reason again is that the FCC places a large amount of responsibility for operating within the rules, on the ham operator himself. He is supposed to know where the end of the bands are, and know enough not to go beyond. Same with the 1500 watt power limit. I can legally run an amplifier that would put out 5 KW at full drive, but I am responsible to insure that the output level never exceeds 1.5 KW.

That is the difference between the ham radio service, and a service such as CB or GMRS, where technical conformity is maintained through special equipment requirements called type acceptance.

It seems like it is all over & I got my idea of 10 codes from when I first got on CB in the 60's & the MARYLAND STATE POLICE had these 10 codes

Radio Codes & Signals

Email us your Radio Codes or Signals

==MARYLAND STATE POLICE 10 CODES

10-0	Caution
10-1	Unable to copy - change loc.
10-3	Stop transmitting
10-4	Acknowledgement (OK)
10-5	Relay
10-6	Busy, unless urgent
10-7	Out of service
10-8	In service
10-9	Repeat
10-10	Fight in progress
10-11	Dog case
10-12	Stand-by (stop)
10-13	Weather -- road report
10-14	Prowler report
10-15	Civil disturbance
10-16	Domestic problem
10-17	Meet complainant
10-18	Quickly
10-19	Return to______
10-20	Location
10-21	Call _____ by telephone
10-22	Disregard
10-23	Arrived at scene
10-24	Assignment completed
10-52	Ambulance needed
10-53	Road blocked at ____
10-54	Livestock on highway
10-55	Intoxicated driver
10-56	Intoxicated pedestrian
10-57	Hit & Run (F, PI, PD)
10-58	Direct traffic
10-59	Convoy or escort
10-60	Squad in vicinity
10-61	Personnel in area
10-62	Reply to message
10-63	Prepare to make written copy
10-64	Message for local delivery
10-65	Net message assignment
10-66	Message cancellation
10-67	Clear for net message
10-68	Dispatch information
10-69	Message received
10-70	Fire alarm
10-71	Advise nature of fire
10-72	Report progress on fire
10-73	Smoke report
10-74	Negative
10-75	In contact with ______

10-25	Report in person (meet)
10-26	Detaining subject, expedite
10-27	Driver's license information
10-28	Vehicle registration info.
10-29	Check for wanted
10-30	Unnecessary use of radio
10-31	Crime in progress
10-32	Man with gun
10-33	EMERGENCY
10-34	Riot
10-35	Major crime alert
10-36	Correct time
10-37	Investigate susp. vehicle
10-38	Stopping suspicious vehicle
10-39	Urgent - use light & siren
10-40	Silent run - no light/siren
10-41	Beginning tour of duty
10-42	Ending tour of duty
10-43	Information
10-44	Permission to leave ___ for
10-45	Animal carcass at
10-46	Assist motorist
10-47	Emergency road repair at ____
10-48	Traffic standard repair at
10-49	Traffic light out at ______
10-50	Accident (F, PI, PD)
10-51	Wrecker needed
10-76	Enroute
10-77	ETA
10-78	Need assistance
10-79	Notify coroner
10-80	Chase in progress
10-81	Breath test
10-82	Reserve lodging
10-83	Work school crossing at _____
10-84	If meeting _____ advise ETA
10-85	Delayed due to
10-86	Officer/operator on duty
10-87	Pick up/distribute checks
10-88	Present telephone # of ______
10-89	Bomb threat
10-90	Bank alarm at _________
10-91	Pick up prisoner/subject
10-92	Improperly parked vehicle
10-93	Blockade
10-94	Drag racing
10-95	Prisoner/subject in custody
10-96	Mental subject
10-97	Check (test) signal
10-98	Prison/jail break
10-99	Wanted/stolen indicated

==
=

MONTGOMERY COUNTY POLICE:

10-1	Receiving Poorly
10-2	Receiving Well
10-3	No Transmitting Except Emergencies
10-4	Acknowledgement (message received) Two Man Unit
10-5	On The Scene
10-6	Busy
10-7	Out Of Service At (location) Code_____
10-8	In Service
10-9	Repeat Last Message
10-10	Out Of Service, But Available For Call At (location)
10-11	You Are Dispatching Too Rapidly
10-12	Advise Weather & Road Conditions
10-13	Request Wrecker For Passenger Vehicle At (location)
10-15	Transportation Prisoner In Custody Code______
10-16	Wish Too meal Unit______ Of (location)
10-19	Request Shift Commander At (location)
10-20	What Is Your Location
10-21	Request Field Supervisor At (location)
10-22	Cancel Or Disregard Last Message
10-23	Check For Valid License
10-24	Contact Your Desk Clerk, Your Convenience

10-25	Do You Have Contact With______
10-26	Report To Your Station
10-27	Advise A Phone Number Of______
10-28	Registration Check (listing)
10-29	Check For Wanted/Stolen
10-30	Does Not Confirm To Regulations
10-31	Do You Have Any Calls For Me?
10-32	I Have Nothing For You
10-50	Officer In Trouble, Needs Immediate Help
10-51	Request Assistance At (location) (no emergency)
10-60	Return On Wanted/Stolen Check. Wanted/Stolen In Indicated
10-70	Units Stay Clear Of (location) Survellance Underway
10-97	How Is My Reception
10-99	Message Acknowledged, One man Unit
10-100	Riot Or Large Disturbance In Progress At (location) Request Assistance

BIG difference. I'm really surprised that you don't know it.

Compliance with FCC part 15 or "FCC approval" is required on any and all receivers, tranceivers, computers, or any electronic device that has an oscillator source of a frequency greater than 10 Khz. The purpose for part 15 compliance is to ensure that said device does not emit harmful radiation (interference) to other services.

NOT to be confused with "Type acceptance", which is a special set of technical requirements that are assigned to tranceivers used in certain communications services, (above and beyond Part 15) designed to ensure that a non-technical user will always be within the technical rules of the service. Things like modulation limiters, 4 watt non-adjustable power output, 40 channel (as opposed to variable frequency) control, are examples of requirements for part 95 type acceptance. There are similar rules for the GMRS, Land Mobile, Marine, Aeronautical, and other 2-way services.

Since responsibility for technical conformity for the Part 97 amateur radio service lies with the ham operator himself, the radios are not required to be type accepted (But they still have to be part 15 approved).

>
> Your trying to say the same thing as the rest of the group.. But looking

Only because it's NOT the same thing.

Dave

I get all of this from the FCC & as soon as I find the right ones I will
send it.

Only problem is that illegal CB operators seem not to be deterred
by type accepted radios. :(

Why should I practice those acts.

I learned from the best.... YOU, Joe.

You have done nothing different than I am with Pee Wee, but yet you find it so easy to ruffle my feathers whenever you want....

What's the matter... Someone practicing your own tactics seem to piss you off a little?

Joe, your still an asshole!

First off, your link doesn't work.

Second, where does that clause state that you may run Packet radio on the 11 meter band.

It doesn't you idiot!

Yes it is,

Morons such as yourself need not apply.

;-)

Have a nice day.

RULE 20 - Telephone Patches and Telephony with CB - [TOP]

{A} You MAY connect your CB station transmitter to a telephone if
you
comply with ALL of the following:
[1] You or someone else must be present at your CB station and
MUST-
(i) manually make the connection (the connection cannot be made
by
remote control);
(ii) supervise the operation of the transmitter during the
connection;
(iii) listen to each communication during the connection;
and
(iv) stop all communications if there are operations in violation
of
these rules.
[2] Each communication during the telephone connection must
comply with
all of these rules.
[3] You must obey any restriction that the telephone company
places on the
connection of a CB transmitter to a telephone.
{B} The CB transmitter you connect to a telephone must not be
shared with
any other CB station.
{C} If you connect your CB transmitter to a telephone, you must
use a
phone patch device which has been registered with the FCC.

there, it work & I wan to thank you for not cussing as well :-) The link
worked for me.

If you really believe this, then why don't the major manufacturers pass out the mods for unlocking MARS / CAP ? gen Coverage with the purchase of a radio, or at least with the license for an amateur radio...

I would think that if it wasn't law, they would do it, just because it "enhances" the functionality of the radio!

Wait a minute. I remember seeing an advertisement for a Kenwood radio, when the general coverage units came out that specifically said to comply with FCC rules, they would not release the MARS /CAP mods without proof of proper license.

And as far as any amplifier being legal, if that was true, the Henry 8K

Ultra would be legal for shipment in the US, as would the Commander HF-2500E.

I specifically know that neither of those amplifiers are legal for sale in the United States.

Also seems to me that somewhere I either read, or was told, that their is a cap as far as plate dissipation of an amplifier that would be marketed to the amateur community.

That, my friend, is why the two hole Alphas (8877) where not offered for sale in the US.

My comments stand.

Not to be an ass, but I personally know three amateur radio ops (2 generals, 1 advanced) within a 10 mile radius who operate in excess of legal limit, One of the guys uses an old 300a palomar to drive his henry, Which he has upgrade the 2 3-500Z to 4 3-500Z and a larger xfmr, and I have personally seen him do this, but I also would not think of sharing their names, as these guys are very good friends of mine. but it does happen. It just seems to me that they only tell us "legal" CBER'S!

And, for the last time, moron,

The rule says nothing about Packet radio.

Packet radio is NOT the same thing as a phone patch.

Quit posting disinformation and wrong posts to the newsgroup. It is fairly
obvious that you have not a single idea of what you are talking about, now
quit showing the rest of the world!

Toll Free

Because you acted just like an idiot when you where posting as Pee Wee.

Luckily for the sane-minded people, their is only one person like you in the
world!

Except for Clinton, that is!  ;-)

Anyway,

Toll Free

This is a multi-part message in MIME format.

--------------216109AE84
Content-Type: text/plain; charset=us-ascii
Content-Transfer-Encoding: 7bit

Attention Everyone,

  Watch out for these.......

            Jack

  http://www.angelfire.com/az/firecommunications/
```

--------------216109AE84
Content-Type: text/plain; charset=us-ascii; name="budweisr.txt"
Content-Transfer-Encoding: 7bit
Content-Disposition: inline; filename="budweisr.txt"

Contents as follows:
EXTREMELY DANGEROUS

This information came from Microsoft yesterday (9 Sept 99) morning. Please pass it on to anyone you know who has access to the internet. You may receive an apparently harmless Budweiser screensaver, entitled BUDDYLST.SIP.

If you do - DO NOT OPEN IT UNDER ANY CIRCUMSTANCES, but delete it IMMEDIATELY. Once opened, you will lose EVERYTHING on your PC. Your hard disk will be completely distroyed and the person who sent you the message will have access to your name and password via the internet.
As far as we know, the virus was circulated yesterday (9 Sept) morning. It's a new virus and extremely dangerous. Please copy this information and e-mail it to everyone in your address book. We need to do all we can to block this virus. AOL has confirmed how dangerous it is and there is no Antivirus program as yet which is capable of destroying it. Please take all the necessary precautions and pass this information to your friends, acquaintances and work colleagues.

--------------216109AE84
Content-Type: text/plain; charset=us-ascii; name="funprog.txt"
Content-Transfer-Encoding: 7bit
Content-Disposition: inline; filename="funprog.txt"

This is extremely important. There is an exec file going around called "Funprog.exec" and it contains the CIH virus. If you receive it, DO NOT DOWNLOAD IT.

But here is the worst part of it. This virus is being sent out from names you know. Somehow they found a way to use other peoples screen names and send out mail. If you are an AOL user and you get mail from anyone on AOL including me that says @aol.com after the screen name DO NOT DOWNLOAD that piece of mail. It will not be from that person that you think is sending it to you.

AOL is very aware of what is going on right now. Please do not download anything. I rather all of us be safe than sorry, until AOL fixes this problem. Please forward this letter to all your friends.......

 Keep in mind the antenna has to be small enough to fit in my luggage
(air flight) and something that won't potentially damage the rental car.
Small mag mounts might work, though I don't know which ones would be
best and fit in my luggage!

your best bet is to go  with a small
mag mount antenna I`m a avis car  shutteler i drive between idaho to
utah to wyoming to nevada  where i drive rental cars to & from and my
handheld help out a  lot with  traffic reports, talking  to other
shuttelers   and  we  don`t leave marks  on the cars and the magnet
mounts  are small to keep in a brief case that`s my 2 =E7

This is a real nice unit that works good. A much needed test center for a shop, individual or anyone that wants to test the operation of their CB. Looks and works good. $125 + shipping

tollfree wrote:
<<No, The chuckle signifies that a ham is admitting that he uses his amateur radio on the 11 meter band. Something that I knew would spark an interest from you.>>

I think the chuckle is also one of recognition, i.e., acknowledging a fellow bootlegger. But that didn't really 'spark' me too much. However this did:

tolfree wrote:
<< I have seen nearly 8 grand out of the Commander HF2500E with my Kenwood driving it. It is a 3 tuber, export only.>>

What kind of an idiot would put 8KW on the ham bands? (I expect your usual lame excuses: it wasn't the ham bands, I used a dummy load, I didn't say it was my amp, I didn't say I did it, it was all theoretical, it was only for 10 seconds, I was in Brazil at the time, etc)

X-Admin: news@aol.com

some thoughts:
1) regardless of what other people have said,
you do NOT need a "marine" cb. a cb is a cb. the only difference between a land cb and a marine cb is a marine cb is more water tight so salt or moisture won't get into the circuitry. there's no difference otherwise.
2) if you're swr is below 2.5:1, you will NOT "burn up" your radio. it's obvious that you are using some kind of cb antenna.
it is correct that you can't use an antenna made for vhf marine freqs on cb but if you were, you wouldn't get a low swr.
3) if your boat is made of metal and your antenna mount is connected directly to a piece of metal with a large area, (approx 5X5 sq ft or more), it doesn't matter what kind of antenna you use. a land mobile would be better in this case. if your boat is wood or fiberglass, you need a marine or no-ground cb antenna. these have special tuning stubs, coils or capacitive circuits in them to fool the radio into thinking it has a proper ground plane and keep the swr low.

they arn't the best solution and somewhat in-efficent but are acceptible. they generally arn't made for linear amps or unusally high powered radios like rci 2970 for example.
4) the question that nobody has asked yet is, just what kind of range are you looking for?
using a no-ground antenna over flat water at 5 watts you may get 5 or 10 miles at best.
if you are trying to reach a land mobile, not on the beach, less.
a base near the beach with a high antenna, maybe more.
if you are using a decent quality mobile antenna mounted to a metal boat, you could and should expect more.
good luck.
jeff

You do have a point. BTW for you & all others;

THE REASON I WAS FORCED TO CHANGE FROM PEE WEE TO CBKING WAS BECAUSE OF THE PEE WEE ON TV & SOME PEOPLE WERE ACTING LIKE *JERKS* MORE THEN YOU ALL & WERE EVEN DOING THIS ON THE AIR.

END

Guy, before you go any further, do some research on what a "packet" is in terms of computer terminology. Then apply it to radio. This may help you understand what you are failing to explain.

I would not use one of these things, If you are going to run an amp through a coupler, you'll achieve a lesser signal in the distance byfar than what you would get by simply sticking a mag mount Wilson 1000 on your trunk lid or the top of the car and just running the radio by itself with no amp.

>That's not to say that codes do not have their place. They were designed to shorten transmission time, for necessary traffic. They aren't really needed on CB, during casual conversations, and IMHO sound a bit silly.

I think your wrong here. Q codes are meant to make communication more efficient, and during DX'ing on CB you need to get your contact going quickly because the band opening may go away quickly. It helps to use Q codes to obtain the desired info from the distant station as quickly as possible because you may not be able to hear them at any second.

If your taking SSB around town, then your right, no Q codes are necessary, but if the operators who are chatting tend to do more DX'ing than local, they are going to use the Q codes out of habit.

I think you are wrong. QRT means that you will stop transmitting. This means that you could either be turning the radio off or that you will be standing by monitoring. By letting the other operator know you are standing by, lets them know they can get in touch with you if need be.

How about a model 222. Its 36' and can handle up to 125mph winds.
Note, this is a military grade antenna that will handle up to 25Kw
from 1.6-30Mhz. Goto their website: http://www.shakespeare-ce.com

The 225 is a decent, economy model amp. Exports R Us has them on sale for $80. That's an incredible price. The only thing that might bother you about that amp is that the SSB delay is always on. That means you have to wait for it to unkey before you can hear anything when you're on AM. The 225 is the low-cost model model in that line. The XL series (200, 250, 350, 450, and supposedly soon to be 600) are the better units in the Blue Face (can say Cobra, Galaxy, Magnum, or Palomar on the front--but they all have blue faces) line. The XL series units have four power levels instead of three, more output filtering, more heatsink surface area, and a switchable SSB delay. Since you're using a SSB radio, I suggest you spend a little more money and go with an XL series unit so you'll have a switchable SSB delay. In particular, the 350 matches up very well with a tuned up Grant. On the other hand, it's a fairly easy modification to add a SSB delay switch to the 225. You can do that and save some money. The 225 is an incredible deal. I sell the Blue Face line as well as Texas Star and Pirate. If a customer wants a 225 and is using a SSB radio, I'll offer to add a SSB delay switch for $15. I use a large, red, push-on/push-off switch mounted in the rear panel or a rocker switch mounted in the plastic bottom panel so that the front faceplate retains it's clean,

```
stock appearance.  I can't come closr the $80 price that Exports R Us
offers, so you might want to check with them and see if they'll add
the switch for you (if you don't feel confident doing it yourself).

the other responder told you to ask icom for the mars mod. they probably won't
give it to you without a mars or cap permit.
i haven't tried it but my book says icom made 4 versions of this radio. i take
NO responsibility for ANY of this but here is what my book says:
on model 1 remove D12.
on model 2 remove D13.
on model 3 remove D12 and solder in D11 and D13 using icom part# DAN202U.
on model 4 remove D12 and D13.
these are all chip smd diodes so be careful.
```

the book warns that you should determine which model you have before starting
this mod.
you're on your own on this so be careful.
good luck.

David,
The old sayig goes "You get what you pay for" that is ever so true
with the radio. Me personally have never ran the 225, but from what I
hear from MANY people they are junk.#1 they are MASS produced, that for
one shows that the quality would be less desireable. Now a question for
you. Why would you want to run an amp on AM? #1 You will be breaking the
law, #2 your neighbors will more then lkely hate you for the RFI. Now
I'm not gonna' nit pic here at that cuz I have used an amp a time or 2
so I'm no hipacrit (how ever you spell it) In my opinion David...try for
a Texas Star or a DaveMade. You mght pay a lil more..but I can assure
you that you won't have too much problems with it. (as long as it's
hooked up right of coure) Good Luck
73's

expect about a 100 watts ssb and about 30 watts am at 12 volts. they seem to
draw a huge amount of current so i dont think there very effecient at all and
they over heat fast so keep a fan on it but its a good buy at 99 brand new

if you call or write fair radio co., (a surplus house), you can, for a mere $4000.00 plus, buy a surplus 10kw amp, (tubes extra), that runs on 480 volts. the biggest obstical that i can see to getting one up and running is explaining to the power company why you want a 480 volt mains run into your house or buying the truck, diesel generator and cast iron antenna to handle that kind of power to go mobile.
other than that, they don't ask for a license of any kind.

this is where we get the best out-band equipment and the heck with those who don't like it.
if they want to keep cb'ers out of ham fests, make people show their license to get in.
other than that, the hamfests in new port ritchy and zepherhills florida is my favorite place for good, cheap non-radio electronic parts. the prices beat rad shack hands down.

Bill, Tim and all gang members,

The Palomar 225 is an excellent amplifier.
200 - 225 on am and 225 - 250 on ssb........

Bill, forget the switch....locate the delay timing capacitor (electrolytic) and replace with a smaller value....I like the extended delay because it allows for break-in by other stations or the occasional "QSK" and forces responding stations to listen during the switchover period! The extended delay is provided to extend a "courtesy" to other calling stations when operating in ssb mode!

Courtesy is in dire need of restoration on all the bands.

I use one daily and have no trouble working my share of international dx with a cobra 148gtl........

Keep in mind that to raise your signal by one s-unit you have to increase transmitter power four times to pull it off! The best stations and operators in my mind are the ones who can establish and maintain contact with the minimum amount of power necessary!

Jack

Quite a few people. Ask Command Technologies (or their sister company, QRO Tech.) how many of the export amplifiers they have sold.

(I expect your usual
> lame excuses:

I don't use any excuses, and now you are fishing. Your usually a little better than resorting to lies, Joe... Guess life must be getting to you. If I was running illegal power, it IS wherever I want to run it. I have never made a secret that I am capable of running illegal power, nor do I make it a secret that I occassionally do it!

> it wasn't the ham bands,

Sure was. 20 meters to be exact!

> I used a dummy load,

Nope, into my long wire. I use quite a big balun.

I didn't say it was
> my amp,

As a matter of fact, no, it wasn't my amp. I make a good living, but I prefer to build my own equipment.

I didn't say I did it,

No, I did say that I did it.

it was all theoretical,

No, theoretically, the amplifier is only capable of about 2500 watts output. After all, it is only 3X3CX800A7s.

it was only for 10
> seconds,

Actually, I only keyed it for 30 seconds. I thought that was enough. That, and the wiring was getting a little warm. I am only wired with 4 guage to the mains.

I was in Brazil at the time, etc)

Nope, right here in Texas!

Joe, your still an asshole, and I really like how you have turned most of your attention to me. It is quite nice to see that I can still fascinate you after all these months.

Please don't seek any of that professional help you so richly need, as you might find out that I am not that bad of a person, and you have wasted the last couple months of your life devoting it to me!

my uncle was a general ham before he died 3 years ago.
he bought out a closed cb shop i savannah ga and bought up a bunch of ham equipment in hopes of opening up a shop when he retired.
his dreams never materialized as he died.
i went to visit my aunt shortly afterward and her livingroom floor and furniture was COVERED with radio gear. she said take what you want.
at the time, i had a ford tempo with the wife and 2 kids plus myself and the car packed so tight with stuff for the rest of our trip to w va, that all i could manage was a few antennas. the car was packed so tight, the springs had to be replaced after the trip.
when we got back, i tried to put her in touch with a shop that would go from here in fla and buy it all. she never called back.
i found out later that she threw it all in the trash.
I NEARLY CRIED AS I KNEW MY UNCLE PROBABLY CRIED WHERE HE WAS TOO.
i was ready to dive into the savannah dump but couldn't get time off work.
i have a van now and will NOT miss another oppertunity like that again!!!

Yes i have noticed that this antenna is "KICK ASS". I have one also.
Do not say that it "CAN WHOOP ASS" on the 102 stainless however.
 If you do you'll get blasted by the conventional thinking among us.
Just be quiet and enjoy your higher gain, lower profile antenna. No
need to promote the secret to your success. Keep them scratching their
heads while you "KICK ASS" on the competition.

Subject: Texas license plate question

Question on the meaning of life and Texas license plates.

Last night, on southbound Hwy 17, a Chevy SUV type vehicle with a Texas plate "TEN 300" nearly clipped me.

It was nothing personal. He nearly clipped several other cars, motorcycles, big rigs, etc. while suddenly and jerkily changing lanes without signaling. Or giving any indication, of any sort, to the careful observer that he was about to do anything other than remain in his own lane.

Oh, and he didn't necessarily pass any cars - sometimes he just changed from one lane to another, stayed in that lane for a 100 yards or so and then changed back into the same spot in traffic he started from.

Finally, got up the courage to pass him (and, I will admit here to the unbecoming prejudice of assuming it had to be a woman with small children). The driver was male, somewhere in his mid 30s to early 40s, wearing a light tan business suit, and

READING A NEWSPAPER.

In commute traffic. On Hwy 17. [1]

So. What does the "TEN 300" plate signify? Is this part of a pattern embossed on license plates by the great (at least its bigger than Britain - but, then, most states are) state of Texas to be given to idiots?

Those who are idiots even by Texas' standards?

Inquiring minds, etc....

[1] For those not conversant with Bay Area geography, Hwy 17 was the first freeway built in California (IIRC) and is a nice little mountain road with lots of blind, decreasing radius curves, which is now a major artery into/out-of Silicon Valley. It carries, oh

perhaps, several tens of thousands more vehicles per day than it
was designed for. For political, geographical, and financial reasons
it can't be expanded.

Having graduated from Harbor High, I can sympathize with you and Highway 17!

Tomorrow I interview for a position that will bring me back to Santa Cruz...
God, how I miss it so!

No, I never said that I was proud to do it, just that I do it occassionally.

You seem to be the proud one... Acting like the cop who found a pound of dope when he was writing the guy a ticket...

Then, he becomes the local hero because he found it... Not on any merit of his own, but because he stumbled upon it.

So, Joe.. From this end, nothing seperates you from the second class cops that permeate the force, and give the first rate ones a bad name.

Ever the Asshole that you are, Joe..

The guy probably really isnt even gay. He is just trying to rattle someones cage. I travel all over eastern US and hear people on the radio doing this. Once some trucker bites they usually say something like "I'm not really gay but sounds like you could be".If everyone leaves him alone and he will go away.

Hi Tim, long time since I have heard you on here. Last I heard you had a new kid. I got rid of my HTX-1000. Wife still has the tag# on her Jeep though. That was a wild coincidence. Finally tried switching the voltage on the USB pin on the processor. Takes care of the readout problem when you go to LSB. At least it seems too. I tried it on a dead radio that only the uP board was working on.Send me the mod as I would like to see what finally happened to it. I know one thing I did different on them was to lift the end of the resistor feeding the chokes instead of lifting the chokes. This kept the bypass caps closer to the end of the chokes. I had an instability problem in one radio that this cured.

The first radio I operated on was a big old Midland base radio (Can't recall the model). 1970's AM/SSB 40-channel radio (black in color) W/a PLL02A chip inside. It belonged to my father. What a great radio! It's still operable today, though not used any longer as of a few years ago. It was tuned up professionally and put out 11-watts dead-key when set on MAX. It never had the frequency expansion done, so it's stock other than the extra power output.

My next radio (which I officially owned) was a Cobra 148GTL. I bought it while I was on vacation from a truck stop back in '93 (my young age is showing here...I was 18 at the time) for about $185. I knew they were great radios, and just had to have it. Back then their were no local sources for any type of radio equipment, except for Radio Shack, and I didn't care to own something from them.

Since then I have purchased many radio and other items. For a fairly complete list, along with some more info about myself, stop by my CB page. Two links are provided within my signature below...

>OK Steve, you asked for it! Ill use just one example for the purposes of sparing bandwidth. Go out and purchase a Diamond, Comet or Larson antenna and dismantle any one of them.< (SNIP)

Still doesn't answer the question about products that deal solely to the Amateur market. BOTH of the manufacturers you cite also have antennas in the Commercial realm, and those antennas cost even more than their Amateur counterparts, although they are the exact same antenna.

>Look at that guy Fred Maia. If you go to his website, you'll see that he advertises that HE can get a person a Vanity callsign for $20, when in fact a person can fill out the form themselves and submit it to the FCC for $13<

The fact of the matter is Fred Maia is a Huckster and a SnakeOil Salesman in my opinion, but nonetheless, what he is doing is not illegal. Some people are willing to part with that few extras bucks to have someone else do the paperwork for them.

The FACT still remains that YOU have not made ANY valid point, and that in each case you try top present as any documnetary evidence is only further PROOF that we all have options AND the freedom to choose between Generic and Name Brand.

>(I just did this for a family member recently). Mr. Maia has recognized the fact that some Hams will pay more to him for this service. This is another short example.<

And some people will pay a delivery boy and extra $10 to run to the grocery store for them when they could do it themselves for free....and they don't even HAVE a Ham Radio license...so what? LOT'S of people will pay extra money to have something done FOR them just to say they did it. No big deal, Wildcat.

I ran a T.S modulator(one 2290) into a DX350 with good results(thats exactly half of your 500). I keyed up the modulator at 3 watts with a 80 watt swing into the dx350(two 2879s) and ended up with a 75 watt carrier and 500 watts of swing. I can tell you this: It sounded like 1kW.......... And yes it did take out all 40 channels with bleedover....

It's the same as the Tram D62, Browning Baron, and 132XLR.
Single conversion receiver. The PLL is limited on extra channels.
For the channels you do get, the radio itself will not operate
the full range. The clarifier operates on two different relay-

switched voltages, depending on what mode you're in. Makes
it a pain to modify. The main board has traces on both sides and
is really fragile and sensitive to excess heat from soldering irons.
The mods aren't worth doing in my opinion. I had a stock one
last year and dumped it on ebay. Hope that helps.
Larry

Craig,
That sounds like a great idea. When you are finished let me know the URL
and I will add a link to it from Toll Free's site. I like what I saw on
your site so far.

Take care and be safe through Floyd.

I guess you have underscored a very important point without realizing it. If your yield signs are Yellow, then a driver from this area may not know what it means, because they are red and white here in NW OH. Also, up in MI, in their turn lanes they have a flashing red light before the turn arrow. If you can safely make the turn, you can go. I'd never seen that before. It took several long honks and nasty stares to get the idea. I also understand that in some areas, traffic lights are mounted horizontally. Wouldn't that mess with someone who just figures if the top ones lit, stop, bottom means go!

He doesn't need to be licensed to operate in the CBRS. Also, the radio operator doesn't have to do anything more if he if running a legal, clean station. All consumer electronics have a statement on the back that basically says if you get interference from legitimate radio services, tough. AND, if your consumer appliance generates RFI (touch lamps, anyone?), you have to stop using it. A courteous operator will offer advice, and try to help, if he is approached nicely. Pin his coax, or damage his antenna, and he may not be as willing to help.

i have some transistors in a TO-5 case that I used to use in old CBs as finals. They required the addition of a heat sink to turn them inti a TO-39F style case. I have found that by placing two transistors in paralell that they will replace the MRF477(40 watts PEP on an HR2600). Unfortunately I have not been able to identify these transistors and only have a few left. Ive reachearched this as much as I can and cannot find anything in a TO-5 case that sounds like it would work. Any ideas guys what they could be. I used to have some transistors for repairing CATV amplfiers. This is the only thing I think they could be. These things would handle a watt or two with no heat sink.

>> Texas Star's are very trashy on the spectrum analyzer.<<

>Not on my Spec An. Your mileage may vary...As a matter of fact, the new Texas
Star equipment was tested by an FCC lab!
Can you say that about any of the other manufacturers stuff out their?<

ANY Texas Star run on my Astron PS in my home will tear up everything in the
house.

>And you are not running a Class C box, either. If you put a Class C box at
>home, it will rip up your neighbors unless the rest of your install is
>"Perfect!".

My reference to the X-Force X200, (1) 2sc2290 x (2) 2sc2879's is indeed class
C, and the ONLY mobile box that has not interfered with the TV picture, TV
speaker, stereo signal or speakers, and very faintly into a cordless phone. I
was even able to use it to drive an Amp Supply LK500ZB 220v base amp with (2)
3-500z tubes, and the exact same results.

I currently use a X-Force XT400 (2) 2sc2290's x (4) 2sc2879's biased class B, it is also very clean, although does come over the cordless phone a bit more.

And if you can name one cber that isn't running illegal power, you can
probably name 300 who are.

More than likely another hoax, here is the tipoff phrase, "Please copy
this information and e-mail
it to everyone in your address book." Just what the hoax is designed to
do, get everyone to send it to everyone else they know, advising them to
do the same and the only thing accomplished is a traffic jam on the
Internet. You will find this phrase or something similar in almost every
virus hoax.

Hmmm.  So what happens if they're removed?  I have a problem with my
2510 going into oscillation upon transmit.  A Dejanews search
mentioned removing these caps as a solution to the problem.  I tried
it (note: I know people who have removed the caps because they claim
it gave them more swing; while I that isn't my intent I saw that it
didn't immediately damage their radios so I was willing to try it,)
and it has worked perfectly so far.  But I'm wondering what other
effects it's had on the radio.  Any theories?

Thanks
Ben

>Unless you own a company that caters exclusively to Hams. Then you can charge as much as you want because you know they'll pay.<

OK, "Wildcat", I give......

What company caters exclusively to Hams?

If you are going to quote any of the current manufacturers of electronic equipment used by Radio Amateurs, CBers, or FRSers, you can save your time because I can disprove it before you get started.

Motorola....? Don't even go there!

Yaesu...? Commercial line known as "Vertex"

ICOM...? Commercial line under their own name

Kenwood...? One of the most prolific lines of commercial and EMS radios other than Big M and GE, not to mention their entertainment systems.

Henry? I used to date one of the original Henry's daughters. If it weren't for the commercial and military contracts, they would have dropped out of Amateur Radio 20 years ago.

Even such manufacturers as TenTec and MFJ have a commercial market for their products.

Care to try again?

Steve, K4YZ

Hello all,

I'm a newbie in this newsgroup. In fact I'm new to CB. Does anyone know whether using a CB coupler (such as the paradynamics PDC133) to transmit/receive thru the car's FM antenna is as good as using an actual CB antenna? (I don't want another antenna sticking out on the car)

I'm also planning to hook up a RF amp to boost the power > 4W (i'm not using it here in the US). Will the CB-coupler/FM-antenna combination do the job?

Would appreciate any advice.

Thanks.

> OK, "Wildcat", I give......
>
> What company caters exclusively to Hams?

OK Steve, you asked for it! Ill use just one example for the purposes of sparing bandwidth. Go out and purchase a Diamond, Comet or Larson antenna and dismantle any one of them. Then go out and purchase a clone of these antennas or a CB antenna and do the same thing. Compare them. What you will find is there isn't any difference between the CB antenna (both in quality and design) and the Ham antenna, yet the Ham antenna is 200%-500% more money.

A prime example is the Antron 99 11 meter vertical dipole and the Diamond 5/10 (144/440 mhz) vertical base antenna. Both, when dismantled, are manufactured exactly the same way with the only thing being different is the resonant frequency of the antenna, yet the Diamond costs $190 and the Anton costs $40. Now, one can argue that the Antron is more cost effective for the manufacturer because of the demand vs. the number of units manufactured annually, however, there is still a very large discrepancy between the current price of the Diamond and the actual price based on the demand of the Diamond antenna. The Diamond antenna company knows full well that Hams will pay more for a Ham antenna as compared to a CBer paying for a CB antenna. This is only one instance.

Look at that guy Fred Maia. If you go to his website, you'll see that he advertises that HE can get a person a Vanity callsign for $20, when in fact a person can fill out the form themselves and submit it to the FCC for $13 (I just did this for a family member recently). Mr. Maia has recognized the fact that some Hams will pay more to him for this service. This is another short example.

> HF-2500E.

I don't know about those specific amplifiers, but I do know that there are more than a few "legal" ham amps that will do much more than the 1500 watt limit, if driven hard enough. There are no magic "watt limiters" that prevent them from going beyond 1500 watts. It's up to the responsibility of the ham to properly drive and monitor his output for conformity.

Ironically, most of the restrictions on ham amplifiers, revolve around their ease of being converted to 11 meter usage.

The FCC would also question the necessity of an amplifier that runs up to more than 10 KW, even though you are then barely tickling it at the 1.5 KW legal limit. But there are a few that will do 3, 4 and 5 KW and are legal. They just can't have 10 meters in them out of the box, and require at least a 50 watt drive to make full output, and cannot be RF keyed. There are more specific regulations, and I'm sure the FCC site has them if anyone wants to read them.

>
> I specifically know that neither of those amplifiers are legal for sale in
> the United States.

There may be one or 2 regulations that they fail and did not get approval. It may not be strictly their power output alone. If it has 10 meters in it, it can't be legally sold in the US.

>
> Also seems to me that somewhere I either read, or was told, that their is a
> cap as far as plate dissipation of an amplifier that would be marketed to
> the amateur community.

That may be true. But it is a bit above the 1.5 KW limit. Look at any legal amp with a pair of 3-500z's. You know how much they are capable off.

I recently posted looking for am old MC-11A. I believe this was made by General radio Telephone. I am very surprised that nobody responded . As I recall this was a hell of a tube radio. It had a plug in the back that gave you 5 to 20 watts depending on if the plug was in or out. I am recalling this from the 70s so I could be incorrect. Anyone
with additional info help me out please

> It's
> a handful, and they'll go down. 14.313 is getting quieter every day.

No they wont. It will get worse and worse and worse to the point where the commercial interests will justify the 20 and 75 meter behavior as a means of taking bandwidth away from amateurs. When the ITU meets in a couple of years, what do you think will happen? Ill tell you what will happen, The Yeasu, Kenwood and Icom electronics lobbyists will successfully eliminate code to increase membership so the end result will be more radio sales. When this happens look out, because Riley Hollingsworth will need a team the size of the 141st Airborne division to police the airwaves, which they say; "Aint gonna happen".

What you are experiencing at present is the death-nell of amateur radio as you "knew it". You can blame your friends over in Newington, CT for this dilemma because they've been sitting on their hands for the past 20 years with regards to this issue. They have always been more worried about their dues income stream. Publicly they (The ARRL) oppose the elimination of code (to keep the old timers and Life Members happy), however internally they want it removed because they realize the potential of pulling in new members to add to their political lobby to appear as a growing organization as compared to a dying one which essentially makes them no different than the Icom, Yeasu and Kenwood lobbyists. Hell, even the government abandoned enforcement 12 years ago because even they recognized that the amateur base was shrinking.

If you think that what's going on right now is the beginning of "better times" in amateur radio, I truly pity you............it has gotten progressively worse over the past 25 years and it will continue to do so.

Hi, I'm looking to buy an amplifier and see that Left Coast Radio has a

Palomar 225 on sale for $99. Has anyone used this amp? Recommendations? Any other amps in this price range? I need to stay below $150.

I use a Uniden Grant XL and want this amp for both AM and SSB.

I wonder if aluminium wrap in several layers in maybe a two square feet pattern would work with the magnet antenna.

I know I did. I was being a bit facetious (wait... That word doesn't
exist, but I just used it).

>
>
> >

> 1500 watt limit, if driven hard enough.

And a lot out their that will do it with less than my Kenwood puts out. I
have seen nearly 8 grand out of the Commander HF2500E with my Kenwood
driving it. It is a 3 tuber, export only.

Being designated as an export amplifier means that it ships with 10 meters,
but that is not why it is designated as an export amp. It reaches full
legal limit at about 20 watts PEP drive.

That makes it illegal, but do you think that they could not put a small
resistive padder in the circuit if they knew that the FCC would approve it

otherwise?

 There are no magic "watt
> limiters" that prevent them from going beyond 1500 watts.

Sure their is! It is called ALC, but it is also up to the amateur op to
make sure that he is running effective alc.

I agree to your point, but ALC was designed to help the amateur keep power
at a safe, legal level.

 It's up to the
> responsibility of the ham to properly drive and monitor his output for
> conformity.

I agree!

>
> Ironically, most of the restrictions on ham amplifiers, revolve around
> their ease of being converted to 11 meter usage.

That, and drive power, as well as not being able to hit monster power
numbers.

>
> The FCC would also question the necessity of an amplifier that runs up
> to more than 10 KW, even though you are then barely tickling it at the
> 1.5 KW legal limit. But there are a few that will do 3, 4 and 5 KW and

Just barely legal.

 They just can't have 10 meters in them out of the box, and
> require at least a 50 watt drive to make full output, and cannot be RF

Dave,

If I remember, the amateur amplifier may not have dissipation capable of greater than the 2Kw input level that was the legal benchmark of yesteryear.

I will look around and see if I can dig that up.

I can tell you all this.

Their are guys like that everywhere my compny travels, including several around the home area around Philly.

There is a guy I hear quite often that says," I got my nightgown on, I got my pretty red panties on and I'm ready to go to bed."

We try to ignore him but now my drivers are hearing him (or someone like him) nationwide.

He's almost as funny as the guy that is right here close to my base area that is constantly immitatating the character out of the old truckers song " CB Savage" always asking, " Got any Smokey Bears out there; how 'bout any bare Smokeys?"

They are relatively harmless as well as relatively humorous so leave them alone and find out who the " Radio Rambos" are that come into your towns and immediately want to find the local bases and harass the living hell out of them and always try to find some poor fool willing enough to try to find them so they can kick that fool's ass.

Hell, I even get on 19 and a few other channels and have a little good clean fun when I imitate "Ol' Vern Johnson" the redneck with no electricity but has a pedal powered generator that makes his radio put out more watts the faster his wife can pedal it. Sometimes I even live an entire evening as Vern giving everyone on the local base channels pains in the sides from laughing so hard and long. They enjoy it so much around here that Vern has actually become friends with some of the locals.

Thanks for reading my post and have a great day.........

Oh, by the way, if you're ever in the area jump on 19, 24 or 15 and give "Ol' Vern" or his wife "Vernadette Johnson" a shout I'm very sure they and you will enjoy the chat.

No,
The chuckle signifies that a ham is admitting that he uses his amateur radio on the 11 meter band.

Something that I knew would spark an interest from you.

As if it was your business in the first place.

Have that foot removed from your mouth from the Pee Wee thread yet?

I have both.... I use the regular head for AM. It has a higher pitched
Clearer sound that is much louder. the 10 DAL head is less sensitive
and has a lower pitched sound to it. I really don't like the 10 Dal
head at all. The guys like it on SSB so I use it. After all i don't
have to listen to my radio. They do.....

The Sweet Sixteen with a one pill modulator doing 125 or so watts will peak at close to 1.4 kilowatts.

You need to use something like a 250 to get anymore than that out of it.

Toll Free

joe says "proud to be illegal?"
i say damn right!!!
it doesn't sound like life is getting to you, it sounds more like your power is getting to his jealous spot because he can't match what you have and has more to lose, (license), than you do. if you are careful, and it seems that you are, you'll never get caught.
they can't be everywhere at once and that's where the key word careful comes in.
this guilt trip he tries to play doesn't cut it with me. he may be somebody's mommy but he ain't mine!!!
if i should ever get caught, not one dime comes out of his pocket and untill he pays my fine, oh excuse me, forfeture, he should shut up.
SHOW ME YOUR BADGE SHERIFF OR GET OUT OF TOWN!!!
jeff

I have worked on many 2510's. Most 2510s will do an honest 35-40 watts peak on AM from a 10 watt carrier. The thing to remember is to keep that carrier under 10 watts of you want the finals to last. It is not so much the peak power to worry about. Dead keying that radio at 15-20 watts will kill the final.

I have the Transmitter and the Receiver. Condition is good. All original knobs and it looks good no extra holes. The transmitter works fine but the receiver may need a tube, audio quit, all other functions like S-meter and all controls work. These are rare and collectable radios at a regular price.
I want $200 + shipping for both pieces.

if you use an amp on one of these couplers, you will probably be smelling something foul comming out of the coupler, matchbox, your amp and probably your dash board broadcast radio. they arn't made to take any real power at all. these are no more than a radiating dummy load, (a piece of test equipment that shouldn't radiate, not an insult to you), and of no real value for anyone that's the least serious about cb.
this is not an admonition to you but these and the through the glass cb antennas really bug me and, in my opinion, are a big waste of good money but the corperate types don't care about these things.
the only thing that these antennas look good to is your final transistor at or below 5 watts. as far as performance, they are junk.
i'm NOT a cb god but this is my opinion and i hate to see anyone throw away money on these things.
good luck
jeff

Huh?

Question....
What kind of an idiot would put 8KW on the ham bands?

Answer....
"The same idiots who run 50,000 watts at keydown
competitions"!

"But guess What"?
"In emergency situations requiring RACES and other
amateur emergency agencies there are no power limit
restrictions"!

Jack

"Do it right the first time or

don't bother doing it at all"!

You sir are dead wrong. You are probably one of the guys with the"I can run 32 pills on my factory alternator" attitudes, you yourself said factory volts. buy your self a real peak meter and do the right things to the amp and then reply. It takes an alt that has the ass to keep up. this is not something you have "rewound" at Joes alternator and starter!!!!

MR-ASS
Got Down!!!!!!!!!!!!

How much output should I see when driving this amp with a Yaesu 757?
Tubes replaced with supposedly nos 3-400's.On a Swan 1500 meter I'm
seeing 90 from the radio,550 from amp. ssb.Is this about right ? p.s.
All testing done into dummy load.  Thanx  Mark

Hello Steve & Stephanie:

Yes the MC11 and MC11A where great radios, and yes they where made in Burbank Ca, on Burbank Blvd, near Hollywood Way. Nobody responded, probably because everybody else also wants one. Keep an eye on the CB Radio section of E-bay.

The plug on the back of the radio would up the carrier output power, at the expense of losing a little audio. Some of the old timers that use to call the Super MC11A's Junkie Generals, use to wire in a power resistor in the plug wiring allowing the radio to not be too strapped, and still have good audio qualities.

The General Radio Telephone Wattmeters, Model 615, came in versions A, B, & C would read pretty high, as compared to a Bird wattmeter. Maybe this sold a few radios also.

General Radiotelephone also made a MC12, that had a much more powerful modulator, as compared to the MC11A radios. The new modulator in the MC12's used a pair of large tubes for the modulator, where as the MC11 radios used a impossible to get German tube. General also made a very rare SSB CB Radio, called the SB-72. The SB-72 never got off the ground, due to oscillator problems.

Jay in the Mojave

> counterparts, although they are the exact same antenna.

OK, please post Diamonds CB antenna Line for us. You cant because they dont have one. Diamond, like many other manufacturers does not want to cater to CBers because they know CBers wont pay but Hams will. The same goes with Cushcraft, Hygain, and just about every other Ham oriented manufacturer that once had CB lines, of which all of them abandoned their CB products because of the justification of cost. If you're only 30 or less you wont remember.

Name
> Brand.

This sentence doesnt make any sense, in English anyway. My god do you communicate in your QSO's in such a dyslexic fashion?

Hello, no valid point?.............It sounds like you just bought a Diamond 5/10 and you're alittle pissed. That FACT and the POINT still remain valid, HAMs will pay more money for equipment and Ham suppliers know it. Maybe you can explain to me how in an perfectly competitive elastic market a 2 Meter antenna that is identical to an 11 meter antenna (except for its length) should sell for 500% more money. Please post this explaination Steve (without the dyslexia).

That would be about right.

What tap are you running on the plate transformer. If you can find a higher tap, that might increase the PO of the amp.

Keyton,

The only radio in the Soundtracker Series that is worth having is the 148gtlst. It is the only chinese built radio of the bunch in which the soundtracker "circuit" operates as advertised. If you want to experience receiver blasting from nearby stations and reduced power output from the transmitter in a soundtracker radio, buy any of the am models and that is exactly what you will get!

Jack

P.S. Want to make a wise investment? If you don't need a sideband radio just buy the Uniden PC76XL/? and you will be money ahead. You may email me if you would like further information!

"Do it once and do it right, or
don't bother doing it at all"!

Your wrong.

The President Adams and the old style (uPD858) President Grant are the exact same radio, with the exception that the Adams has a scan circuit in it.

I've got a MAXON MCB-30 with a Wilson Ant. in my Jeep and I'm trying to squeeze a little more power out of it. I saw on Bernie's CB web site that there were some adjustments that could be made to my radio. Under the tips and tricks section this is what was listed: RV-1 Squelch Range Adj., RV-2 Modulation and CT1 10.240xtal Adj. There was also a modulation mod; it said to remove or adjust C421. I'm not real familiar with audio circuitry. Can someone help me out here? I now know what to adjust, but how?

I have recently gotten an HH45WXST and used it on a trip through California. First off, the ST can be turned off -- no problem. Push a button and it's off -- push the button and it's on. The ST function on my radio worked extremely well. Overall, the signal to noise ratio was noticeably improved. There was no loss in transmit power and reception was excellent.

I really like this radio -- if you want a Hand Held I'd definitely give it a try. In addition it supports a wide variety of accessories that really enhance its usability. It's very compact with excellent sound.

I've been using CB's of various shapes, sizes and types (no SSB) for about 22 years -- so my thoughts are that while ST isn't an earth-shattering, revolutionary, got to have at all costs feature, ST does perform exactly as advertised -- try it. I didn't find that it cost any extra either -- I like it.

Regards,
Eric

Not that anyone here on the CB newsgroup gives a shit,

But, with 100 watts into a 20 foot piece of wire, I just QSOed with
Louisianna and Arkansas from Houston.

The SWR was horrendous, but the antenna tuner somewhat made up for it.

20 feet of wire on 80 meters... That would be like a 2 foot antenna on CB.

antenna.
> It was a vertical half-wave, 3.75db gain, and sold for around $35.  The
SAME
> EXACT antenna was marketed to hams as a 10-meter vertical and sold for
$55-60!
```

I remember that well. Their where a couple other manufacturers that also
did the same thing.

I know Dean Mosely personally, and he has said the same thing.

>
> In fact, the same thing occurs today with the Solarcon A-99. Copper sells
it
> as a CB antenna for $39.99. AES sells it as a 10m antenna for $64.99.

However, to be completely fair, AES is typically more expensive than the CB
dealers on everything... That has been my experience so far.

> Same thing as the President Grant, but the Adams has a scan feature.

Not inside they're not!

The Adams is an older design and works reasonably well although I have found them to be a little deaf. The audio IC used in the Adams is obsolete and practically impossible to obtain - somewhat worrying as they fail from time to time. Some techs fit a crosswired TA7205 but this doesn't last long.

The Adams scan circuit can be modified to check channels other than 9 and 19 by modifying the diode matrix - details in one of Lou Franklin's books.

>(without the dyslexia).

Although we disagree on other issues, you are right on the money with this one. An even better comparison is Cushcraft. Back before the government do-gooders banned the sale of metal CB antennas, Cushcraft marketed a "Ringo" CB antenna. It was a vertical half-wave, 3.75db gain, and sold for around $35. The SAME EXACT antenna was marketed to hams as a 10-meter vertical and sold for $55-60!

In fact, the same thing occurs today with the Solarcon A-99. Copper sells it as a CB antenna for $39.99. AES sells it as a 10m antenna for $64.99. Which would you choose?

Note: this address does not accept unsolicited e-mail. Please contain all discussion regarding USENET posts to the appropriate newsgroup thread.

> >Did anyone ever get those GE handheld CB's from www.rebate.com and
>
> The correct URL is: http://www.cyberrebate.com/catalog/default.asp

Yes, I ordered the GE radio and a multitool kit. They were here quicker
than I could imagine. The company has just gone through a major change
and a move but still maintained business. I haven't received my rebates
yet but am confident I will. They tell you flat out that it can take
several months so be prepared to wait. The company that makes the
multitool kit that I orderd was really great with customer support.
They are sending me a warranty replacement laser pointer. Mine had a
hairline crack in the barrel. No questions asked, and very quick to
respond. The multitool and knives that were part of it were not
Victorinox or Gerber quality but they were a quality stainless steel and
quite useful.

The radio is cetainly not like my cherokee but still a good performer. Just doesn't have the bells and whistles. You can't charge nicads in it. I use 8 alkalines. It is bulky. It has a screw on antennae and it is almost impossible to get a bnc adapter to use a different antennae. On the brighter side it has a hi-lo power. Performs like any handheld. Has a nice led display. Nicely shaped control knobs. Actually they are oval and not round. This is rather unique. The audio is quite clear and crisp.

There are a ton of them for sale on e-bay and some selling quite high. I wouldn't part with mine. If someone didn't want the hassle of the rebate I'm sure they could find one on the newsgroup or any auction site for 20 or 30 dollars. Even that is a pretty good price for a brand new plain jane handheld.

Before I ordered mine I asked the same question, if anybody received the rebate yet and had no response. Figured if I wait forever they will be gone. I will post it when I get my rebates.

Took the plunge, crossing my fingers, and patiently waiting for my rebates,
Rick B.

I have a few questions regarding antennas. First off is there an antenna available for use over a super wideband? Say from 23-31 Mhz, mobile or base? I understand that antennas are built to have a sweet spot, but just how big can this sweet spot be?

This question is about SWR, particularly mobile. Most people have a reading that is high (1.4:1) on the ends of 11 meter, and low (1.1:1) in the middle. Others have a perfectly flat reading 1.4:1 across the board, but can't get it lower than that. As an example lets say it's the same antenna, different car, but similar mounting; say a Ford van and a Chevy van, Wilson 1000 mag mounts in the middle of the roof, and even same radios. Why such different SWR readings?

The work on the 1st stage of bringing CB RADIO back 10-8 is underway! I am almost done on 2 KCBN WEB PAGES (1 will be on MSN COMMUNITIES & the other will be on AT&T WORLDNET (the ISP I am calling from.) I am in the process of setting up a WEBRING with some CB radio operators. I also have added on both web pages the FCC rules part 95 & I will have links to the all states & county 10 codes as well as ALL LEGAL SSB CLUBS & AM clubs. I am also going to do other things to my web page.Well that is about it & I know that there will be people who like it & those who think cussing is all the codes they need in life. But what can I do about it? NOTHING because it is up to each person on how he/she acts & I feel sorry :-(for those who think cussing is the way of life. I will tell you that besides cussing you all are just hurting yourselves! I us to cuss [not much, but enough to get in to trouble] & I stopped it. I guess cussing is like food once you do it once you can't stop. Later.

--
My 10-20 is Silver Spring, MD & this is CB KING = KBDA-7796 10-10

You are seeing nearly 1300 watts input to the tubes.

And at 550 output, this means that you are reaching the FULL dissipation of those tubes. Dangerous place to be.

Sounds more like the amplifier is not being tuned correctly.

Wait.. What meter are you using? Is it a PEP reading meter, or an averageing type meter? For a PEP meter, you are WAY low. For a AVG meter, you would be on par.

If you convert to 220, the lights shouldn't dim in the house. You will typically see a couple hundred watts extra if sag is a problem (like it seems if you are seeing the house lights dim).

I am also interested in what your plate voltage is like when you whistle, vs at rest.

============
The talk back should not be operational when the echo is off.  The
radio is covered by a 2 year factory warranty, so you should send it
back where you got it, or to Galaxy for repair/exchange.
This is why we test, align and tune every 10 meter and export radio
before we ship them, so the customer won't have to go through the
hassle and expense of returning a defective radio.
Galaxy radios are usually quite reliable, but like anything else made
by man, you can get a bad unit on occasion.  The Galaxy factory
service people will treat you right.

I have the following Radio, and electronic equipment for sale. Will consider trades for Hand held Scanners with full 800 coverage. All Gear working last time tested unless noted. Shipping is extra. Please reply to my email address.
Thanks
EJ (KC5EPI)

All Tube Items:

Tempo-1: All Tube Ham Transceiver with Power Supply. Covers 80-10 meters. Looks good and works well. $200

Pearce Simpson: Guardian 23- All tube CB Transceiver/with mobile power cord and mounting bracket. Looks and works Good. $100

Channel Master: Tube Stereo Receiver (Model 6612) and matching amp (Model 6601) Looks good and plays on FM only. AM not working. $100

Non Tube Items:

HTX-202: Radio Shack 2 Meter HT. Works good. Slightly chipped where the battery slides in, but does not affect operation. No nicad, but I will include the AA Battery pack with the unit. $80

Marantz Model 2220B: 25 year old Stereophonic Receiver, with gyro-touch tuning, blue dial and optional real wood case. This unit is in excellent condition, both in looks and operation I would rate a 9.7. Also have original manual, in excellent condition. $200

AR Inc: Stereo Amp, All solid state. $100

Traynor: Group Two B- Audio Amp Head. High/ Low misc. in puts. Master volume, volume, bass, treble and tone shaper controls. All solid state $125

Swan 14X DC Power Supply Module: No way to test but was told it was working OK. As is $50.

Siltronix Model 90-6 VFO: Excellent condition with three position crystal switch $75.

PRO 2003 Scanner: Radio Shack 50 channel(30-512 Mhz.) Digital Scanner with FM broadcast band included. Have two, one is working the other is a complete non working unit. $150 for both.

Bearcat 250 Scanner: Have two. One working at times and one for parts. $50 for both.

You could build a gamma matched antenna that would be much more broad, but it is best suited for stationary use, not mobile. SWR is affected by many factors including the shape and size of the vehicle, where the antenna is mounted, and also if there are other objects nearby which can affect the reflectivity of the antenna. To compare, you would be better off trying to do so in clear open space.

> I think its in how the car is mounted to the chassis. I know that
different vehicles act different when it comes to SWR....some vans are just
terrible. I have a 86 chevy van and its a real bitch to get the SWR down. I
finally did with a 102 extended to 112"

lets hear it from some of the antenna experts here.....why the difference...

I started my wallet-killing, salary-burning radio hobby back in 1981. My first
rig was a Palomar Skipper Model 73... It was an old tube type 23 channel SSB
rig... When I got it, the gentleman that sold it to me threw in a Sam's
PhotoFact Volume 59 that covered the radio!!! Everyone I talked to said that it
sounded great, and wanted to know if I wanted to sell it... I never did.
I still have that radio to this day, and i still use it once in a while... It's
an oldie but a goodie!!!!

with the big blow heading to northeast u.s. tonite i'll be watching to
see if the jogunn star 5+5 on the roof can withstand the pounding. its
rated for 85 mph so this should be a good test. 73, jim

it seems to me that people would be concerned with how many average watts there doing instead of peak. on am your talk power comes from the average not the peak. i guess those people just like to watch it swing and believe they got more than they do.

the main problem with cb is everybody wants to do there own thing so theres no collective voice. if you really wanted to get things going join forces with one of the well known cb rings and the overall people visiting your site will increase and more people will see the info you want them too. no matter what you do here the cb is not gonna go back like it was. remember all things change with time and the cb is no different. even if we went to being all legal. how are we gonna talk when during the day theres a full scale noise level on all 40 channels? the dx is what killed the cb boom last time and hopefully enough people have extra channels now that they will be able to escape some noise and keep using the radio.

The storm at present (9:30 am EDT, Thursday) has weakened to 90 MPH winds. By the time its gets up to the NYC and New England area, the winds will be well below that speed. Probably 85 MPH gusts and an actual wind speed of 65 MPH +/-. Your beam should be fine.

I was going to take mine down but I decided against it, so; "Thar she blows".

I started out with a "Kraco CB Super DeLuxe" (23-channel version), an old car battery that my dad gave me, and a length of speaker wire which I fashioned into a crude dipole. Hey, it worked! Not bad for a 12-year-old with no money.

I've been monitoring a few local 2 meter repeaters in the New England area and all of the GI Joe Wanna Be's are out in full force. Here's what some of these guys are saying and doing:

They are actually using words like "that's affirmative" instead using of the word "yes".

Saying 0700 instead of 7 o'clock.

Calling their club meeting house the "Command Center".

Instead of saying "Can we send a couple to guys over to the Hospital for a pickup?", they're saying "Can we mobilize several units to MED 1 for a transport".

Most of these guys are feeling the need to report every 5 minutes in what direction the clouds are moving and what color the sky is. So far this morning I've heard that the sky in the same location, at the same time was 7 different shades of gray.

Two guys were actually arguing about which one of them was actually the "Incident Command Team Leader"

One guy is pissed off that he took the day out of work to get his mobile tower trailer ready, and that there's a good chance that we might not even get the storm.

And finally, one Ham is leaving his home for his club headquarters 12 hours before the storm might hit because he's afraid the storm might hit and he'll be trapped with his wife with no utilities for 5 days. ;-)

I've explained it a million times and they still don't get it. I enjoy both ham and CB. Plus scanners, shortwave listening, broadcast band DX'ing, etc. My beef is with blatantly illegal operators of all types who cause chaos and make the spectrum unusable for others because of their unlawful activities.

A review of my posting history will show that I have been just as critical of hams who run their Henrys wide-open on 75m and jam each other as I have been of CBers who run multi-alternator, mega-wattage stations in their cars and wipe out the entire band.

That is the problem.

You are seeing what you should, if those are AM numbers.

That equates to 1200 - 1400 watts PEP output, so you are fine, although I would keep the carrier power down to about 300 watts at that level. That should make those tubes last a good long time.

For future knowlege, you can replace the tubes with 3-500Zs and get about 2 grand out of it. Nice to know after you bought the tubes.

The Swan meter is an averaging type of meter, as far as I know.

No, a license is no longer required to work on this crap.

Toll Free

BTW,
> they are Dits and Dahs, not dots and dashes

That is up to the interpretation of the person talking.

I have heard them called both, depending on the person speaking.

Other than that, it is a question of semantics.

I'm in the market for an inexpensive ($40 or less) SWR meter. Is there much difference between the meters in this price range or are they all about the same?

I am not worried about the damn batteries! All I am wanting to know is if
there is a way to modify these radios so they can perform better than stock!!!!
Better range, cleaner audio, or whatever.
By the responses, you think I was asking a technical brain surgery question!!!!
If you know how to modify this radio to perform more wattage, power, cleaner
audio, anything, please respond.. If you don't know anything simply find
something else to read and don't respond with some bullshit garbage answer that
doesn't answer MY QUESTION!!!.

There you go!! sounds like me with a shortwave Reciever. I have the Radio
Shack SW-100 reciever and fashioned a longwire out of real cheap Speaker wire
and for a plug used a plug from a cheap set of head-phones!
If anyone does try that, Make sure there analog ones as Ive tried a digital
headset pug and it wouldnt work.

Just because the sevice has "amateur" in the name dosen't necessarily mean the operations are or should be amateur in operation. A lot of the emergency communications on the amateur bands are handled very professionally.

<<i have a friend who lived near the coast guard station at the st petersburg /clearwater international airport here in florida who picked up a distress call on 27.585 from a Swiss flagged vessel in the atlantic off the coast of the bahamas.>>

Just curious why a Swiss vessel in the Atlantic would choose 27.585 (from among all other HF and VHF distress frequencies)?

I'm sure the radio officer of the vessel wasn't looking for a freebander to help him.

More likely that 27.585 is a legitimate Govmt comm frequency in the St. Pete/Clearwater or Bahamas area. This fact sort of blows the freebander excuse that "no one uses those freqs."

Get one of the new Unidens, either a Grant LT (SSB) or a PC78LTW. I use a PC78LTW with a Wilson 1000. My range regulary exceeds 12-15 miles. Very good for a barefoot mobile CB with mild mods.

Is there anything that can be done to this radio to improve receive? The radio has a good ground, and is noisy in mobile and bench situations. All grounds look good, and no cold solders that I see. Any tuning precedures for receive maybe?

Just run into a Galaxy Dx44V that the larger copper coil in the back
had a cold solder, barely touched it and it popped up... was making a
lot of noise, etc... this took care of most of it... just thought I
would say something just in case someone was having some noise
problems, and probably would be a good thing to check.

If this is the case then what about public service people and why should they be exempt. Don't they use mikes and radios for extended periods while enroute and for chit chat. What about parades etc. These and other questions must be answered to avoid being discriminated against. Nick

>Funny.... You completely dance around the subject at hand, but seem to think that the rest of the newsgroup is fixated around the 500% claim.<

(1) There is NO dancing around ANYTHING, Toll. Windy asserts a 500% inflation in the price of communications accessories sold to hams vs CBers, and I say he's full of it. And I proved it.

(2) I have no idea what the "rest of the newsgroup" is fixated on, nor do I care. If they wish to participate, they may do so. If they don't, relief is just a mouseclick away. So far though, it's just you, Windy and I.

>100 percent price difference is an OK difference just because of different dealers?<

And I guess you have never paid $1.00 for a small Coke at a concession stand in an amusement park or $2.50 for a draft beer at "the game"? Come on!...The market will bear what the consumer is willing to pay! And if someone is willing to part with $500 to $1000 without shopping around for the best deal, well, the old addage about a fool and his money being parted is true.

>This is a real issue, and as far as I know, the ENTIRE issue? While Wildcat did make a rediculous claim of 500%, you have continued to skirt the issue that he brought up with it, and the price fixing that happens among the amateur Vs CB market.<

Toll, are you on drugs?

Price fixing?!?! HAH!

I can pick up any CQ or QST and spend an hour on the phone getting quotes on any particular piece of gear and get just as many different prices!

Likewise, I can find a Cobra 148 at truck stops for the same 175% difference in price vs dealers like Copper that the Antron "for instance" reveals. I have seen them for as much as $250, when the truth is they can be had for far less!

So what about THAT price fixing, Toll?

>Put up, or shut up. The thread, as well as you, have wasted entirely too much bandwith!<

So, confronted with the challenge of providing a bonafide reference to the ALLEGED price fixing, ie: a catolog reference, etc, and UNABLE to face up to the challenge, you, like the little boy on the school yard who is getting beat at basketball, wants to take his ball and go home?!?!

I DID put up, Toll....I don't need to reiterate for you or anyone else that which is archived here.

NOW...

UPON WHICH PUBLICALLY ACCESSIBLE RESOURCE ARE YOU AND WINDY ONE MAKING THE ALLEGATION THAT AMATEUR RADIO EQUIPMENT IS PRICED UNREASONABLY?

It's a simple question, so I imagine simple minds should be able to answer it!

Got **YOUR** dancing shoes on, Toll?

Steve Robeson

>Gees Steve, It sounds like your a legend in your own mind<

If you say so, Windy.

>An Antron 99 is $40 - A Diamond 5/10 is $190, which is a 470% price gain for an identical antenna (except for the frequency) THIS IS WHAT I ORIGINALLY POSTED, If you go back and actually read the posts, you may become enlightened.<

The Antron 99 is not the same antenna, therefore the analogy between the two is irrelevant. And like anyother manufactured item, you can go Brand name or you can go generic.

>A Wilson 1000 magnet mount mobile is $59 - A Larson 2 meter/ 440 maget mount is $132, which is a 200% price gain for an identical antenna (except for the frequency)<

And as I stated before, there are just as many OTHER antennas out there that can be had for nearly pairity prices, Windy.

My Ford Contour is around $12.5K the way it's equipped. A similar sized Caddy is around $35K to $40K....geez, Windy, both have a steering wheel, stereo, air and four tires...isn't that gouging?

>How old are you anyway? My god cant you do basic mathematics, or at the very least, look at catalogs to compare prices.<

My mathematics skills are just fine, and how old I am is nunya.....As far as comparing prices, there's the rub, isn't it now?

I have the AES and HRO catalogs at hand, and I can access most anyothe resource on-line, as can you. And like you, I am sure I could find numerous cases of any two SIMILAR items, and in some cases the SAME item for drastically different prices. But I can also find them for less, too, which really deflates your numbers in a hurry.

>>I disproved your assertion with verifyable facts.
>
>Verifiable with who? Only you.<

Ummmm, anyone of over 3000 Radio Shack stores nation wide, thier web site, or the catalog from which I quoted the prices earlier.

>Wow Steve, is that the best you can do?<

I COULD call you for what you are, but why go there? This was sufficient.

>Steve Im glad to see you've got a new screen name however the new skill you should be aquiring is learning how to read because you obviously mastered

that skill yet.<

Oooh...very skillful sidestepping, Windy One. But to which new screen name do you refer, save the one where I had my nursing credential included, but which STILL had this callsign in it. No cover-up here, Mr. Artful Dodger.

I can read fine. You can't accept that you have been bested by someone with a catalog and a few minutes of research.

Steve

No. Even with cheap "leaky" coax, the majority of the power is confined between the center conductor and inside of the shield on the cable. It would be more of a problem if your cat were sleeping near the antenna than on the coax.

Besides, CB has miniscule power output, far less than the ANSI RF safety regulation limits for RF exposure near 30 Mhz (225 watts, I think), so even if your coax is "leaky" (poor shielding), he would be safe.

If you're really worried, you can borrow a field strength meter, and connect the coax to a dummy load, and run the FSM along the coax. Chances are, you won't see much RF off the coax unless you're running considerable power.

At ham power levels, you need to worry about this sort of thing.
For CB, not even worth considering.

Why do some hams or people claming to be hams come on CB RADIO & re.radio.cb for? I guess they are either lost or causing trouble. If HAM is so good then why not each person stick to their frequencies! I once got some posts & E-MAIL (On some BBS'S @ a time they had local BBS'S) that I was in the wrong to come on their BBS saying that hams are cussing on CB RADIO & making problems. Remember HAM as people say have good people who do good & all this stuff. If you all do not want us CBers on the rec.radio.ham side or on ham radio messing you all up then stay off of all areas. We have as much right as you to use or talk about CB RADIO! Thamks

I'm really sorry if intelligent conversation offends you. I was merely trying to answer the question posed, but I guess that offends you too. BTW, they are Dits and Dahs, not dots and dashes. (but you knew that already, didn't you, Pinhead)   ;-)

Regards,

Arnie -

> More likely that 27.585 is a legitimate Govmt comm frequency in the St. Pete/Clearwater or Bahamas area. This fact sort of blows the freebander excuse that "no one uses those freqs."

TollFree said:
<<And even more likely, you are completely unaware of what you are talking about (as usual), posting something that you think you can get away with nobody calling you on that makes yourself look better!>>

OK well, "call" away.

27.585 is currently listed as a military frequency in Scan Fan publications (available at all the better truck stops).

27.585 is currently not assigned to amateur or citizens band users.

So there are only three possible conclusions we can draw:

1. This info is a (widely published) typographic error that no one has chosen to correct.

2. The FCC is lying and 27.585 is legal for anyone to transmit on.

3. 27.585 is a military frequency.

While some might desperately want to believe #1 and #2, I think the only sane conclusion is #3. Therefore, casual use of 27.585 by freebanders is an unlawful (as well as irresponsible) act.

I have to believe that the Swiss vessel chose that frequency to issue its distress call not because it wished to contact a "freebander"...but because it is a bonafide military channel.

Yes, it IS fortunate that the incident with the Swiss vessel came to a happy conclusion and that the freebander was able to contact the Coast Guard. But it might just as well have been a very tragic situation if a couple of outbanders using the

frequency inadvertently prevented a Military radio operator
from hearing the Swiss vessels distress calls.

I saw that mod as well as the caps as I was looking, but as I
understood it the negative feedback modification did lower your output
(I'll soon be using this radio with a texas star 500v so I'd like to
keep the higher output). Plus de-soldering one leg of each cap was
simply quicker to do as a first try. Sometime soon, hopefully this
weekend, I'll resolder the capacitors, swap the resistor, and see how
it works.
Out of curiosity, do you (or does anyone) know the original value of
the resistor for, id purposes? I'm just being cautious, as I don't
have schematics I'd hate to find out I replaced the wrong resistor.

Thanks,
dirk

Greetings to all.

A New IRC channel has opened on DALnet IRC, so if you want to join in in a group conversation online - then pop to the http://www.mirc.co.uk/ website to download the latest version of the client software - get connected onto the DALnet servers and join the #ukpg channel.

There are no set topics, and the chat sessions are quite reliable and fast compared to the chat interface on the UKPG website ;-)

It is mostly active in the evening (GMT) - all are welcome for a friendly online chat - mind you it may not be busy the minute you get there, but i hope that a few will remain in the channel so that new visitors don't think its an
empty channel with just me sitting in there!

I look forward to seeing some familiar "nicknames" there.
I'm also looking out for some sensible people to opt as channel opearators to help manage the channel.

Cheers & Regards!

Greg

Sorry guys I didn't mean 1.4 as HIGH, I should have said higher. I was just picking numbers as examples.
I just heard a few locals talking about similar probelms and I got curios.
I was too busy to do some figuring and thinking.

I was wondering, if someone were to put a rather large linear amplifier in a car would it be ok to mount the amp in the trunk? Is it ok to have say 10ft of coax between the radio and the amp? Coax is defined as high quality, not cheap kind. Like other kinds of audio equipment the longer the line into the amps the more suseptible the system is to noise, and if that noise is present then the amp will of course amplify the noise as well. Will having a short line to the antenna cause problems? Using different lengths between the amp and the speakers will have different effects on an audio system, but no problems other than harshness in extreme cases. Sorry if I'm asking questions that sound goofy, but I've just been wondering alot lately.

While contemplating this thread, the following sayings come to mind:

a: "Whatever floats your boat". (THE KEY TO HAPPINESS)

and:

B: "When in Rome, do as the Romans do". (OPTIONAL)

Personally I'm not into codes or jargon of any kind. At the same time, if usuing them makes you happy.....go for it. Life is too short to worry about such trivialities or conforming to the irrelevant rigid expectations of others. So in the spirit of open mindedness I close with the following:

"Heres waving a hand at ya!.....Keep the shiney side up and the dirty side down....catch you on the flip-flop.....we're gone, bye bye!" And I'm off the key. :-)

HELLO!!!! Just because you get a Ham license does'nt mean you are excluded from using CB....Sheeesh! I use 11m as well because I like talking to and meeting new people regardless of what band they operate on. As a matter of fact, I've assisted several CBers in getting their tickets in the capacity of both instuctor, and volunteer examiner.

> I once got some posts &
> E-MAIL (On some BBS'S @ a time they had local BBS'S) that I was in
the wrong
> to come on their BBS saying that hams are cussing on CB RADIO & making
> problems.

It must therefore follow that all Hams are rude unfriendly people right? Following this flawed logic, if you have some unfortunate circumstance with say....a person who collects stamps, your conclusion would be that all stamp collectors are flawed in the same manner....right? Did you consider that maybe your post was taken as being accusatory in nature and prompted the response you got?

> Remember HAM as people say have good people who do good & all this
> stuff. If you all do not want us CBers on the rec.radio.ham side

As far as I'm concerned you are welcome to post on Ham newsgroups all you want.....just don't get mad if you get the cold shoulder after saying something derogatory about Hams.

> or on ham
> radio messing you all up then stay off of all areas.

Sorry....We have just as much right to transmit on 11m as any other citizen. Transmitting on Ham bands however is a priviledge that must be earned, otherwise you'd breaking the law. Get your ticket and we'll welcome you to the Ham bands with open arms.

This response to your post is not intended to flame, or castigate you in any way, nor should it be taken as such. Rather, it intended solely to point out a mistake in logic, and perhaps modify your conclusions about Hams in general. And why not go for your ticket? You won't regret it, I promise.

Ouch! Either way you go it's going to cost you. I concur with the other posters....Peter Dahl is the way to go (if cost is no object). I believe they're still rewinding old transormers as well. Just send them yours with all voltage/tap information and they'll fix you right up. Best bet however, is to hope to find a junker that still has a good transformer and canabalize it. Otherwise, unless you really like that amp, I would reccomend against putting too much money into it (you'll never be able to re-coup it if you decide to sell).

Birds are voltmeters--that is what needs to be understood.

If the amp is an 8 pill, it won't saturate when driven by a
plain radio.

> Since the carrier PEP is the same as the AVG, the two numbers are identical.

That I can go along with.

> This makes it even easier. Crank a 20 watt carrier into your linear, and

Crank a steady tone into your radio that produces a 35 watt
carrier-like output waveform in order to know what the PEP
output is under those conditions.

How come everyone out on the band today has to run power? I myself use to but to me all it does is just increase the noise level out there along with all the other crap you here. Most people don't even know what there doing and they over drive the sh^t out of there amps which really helps. I would say that 99% of the people they are talking to are with a couple of miles of them. Does a person really need 500 watts just to tell some guy f^ck you buddy or go f^ck yourself? True power does give you distance but most of the time people that are hearing you ten miles away can't get back to you.
(Can't we all just use stock power)

This has been talked into the ground before but just to review, since CB is an entirely different service with different rules and objectives, essentially anyone is allowed to use the service without regard to any technical skill that they might or might not have. Heck, even your aunt, Emma, could get on CB if she wanted to, and she is 97 years old and doesn't understand yet how that light starts to glow in the ceiling when she pushes the button on the wall.This means that even some amateurs might use CB to communicate with some people, and yes, they are entitled to use this news group just as much as you are. Some chutzpa to think that they shouldn't be here because they also use another radio service. Same argument would apply if you said that anyone who drinks beer should stick to the rec.beerdrinkers.anonymous news group and stay away from rec.radio.cb. I know this won't clear it up in your mind because it apparently isn't receptive, but it my best effort this morning. Now hopefully you can drop the issue and get back to radio.

CBKING wrote:

> Why do some hams or people claming to be hams come on CB RADIO & re.radio.cb for? I guess they are either lost or causing trouble. If HAM is so good then why not each person stick to their frequencies! I once got some posts & E-MAIL (On some BBS'S @ a time they had local BBS'S) that I was in the wrong to come on their BBS saying that hams are cussing on CB RADIO & making problems. Remember HAM as people say have good people who do good & all this stuff. If you all do not want us CBers on the rec.radio.ham side or on ham radio messing you all up then stay off of all areas. We have as much right as you to use or talk about CB RADIO! Thamks

your cat will be fine. but next time try this: take two or three wraps around the middle of the cat with the coax... next, scratch the cat's back until he puts his tail straight up... this should give you a couple extra dB on transmit depending upon the length of the cat's tail (may require trimming).

In article <zjfC3.43$NW5.7262@news.corecomm.net>,

looking for 11 meter transmit mod for this radio. Found mod for mars and caps freq's but unsure if this is what i'm looking for.

Thanks, Jeff

Did anyone monitor 14232 USB on Tues? I logged USCG working various
ham stations re: a maritime distress call.

This was about 11:00 PM eastern.

RE: emergency communications.
there are no power, license or frequency restrictions to anyone if it involves
a threat to life or substantial property damage.

if you are on a deserted road and you see a cop unconsious on the ground and
you get on his radio, all you will get is a big thank you.
i have a friend who lived near the coast guard station at the st petersburg /
clearwater international airport here in florida who picked up a distress call
on 27.585 from a Swiss flagged vessel in the atlantic off the coast of the
bahamahs.
he called the coast guard and was asked BY THE COAST GUARD to stay in contact
with the boat by radio and with them by phone.
he did and the people were saved.
he also has a certificate of gratitude from the Swiss embasy hanging on his
wall and NEVER heard a word from the fcc for TALKING ON AN OUT-BAND CHANNEL
WITH A MODIFIED RANGER AR- 3300 AND A 100 WATT BASE LINEAR ON   L.S.B.
my guess is that the Swiss would have came to his defense anyway and it would
have looked bad for the fcc in the news papers. i could see it now:
MAN FINED FOR SAVING LIVES OF FOREIGN MARINERS!!!.

Obviously, this radio is out of your league and besides, it is illegal to use
it on 11 meters.

Note: this address does not accept unsolicited e-mail. Please contain all
discussion regarding USENET posts to the appropriate newsgroup thread.

I agree with Toll.  This is the first substantial complaint I've
heard about the Bulldog meters.  All the other posts I've read
concerning them were more or less completely positive.  I tend
to feel that this should just be passed off as a fluke or a troll.

However, I do know of someone in San Diego County who was involved in a bicycle accident (Mountain Biking in the Laguna Mountains).

His friend fell and cracked his head open on a rock. He used his modified 2 meter radio to call for help on the Sherriffs TAC repeater.

They flew lifeflight in, his friend was saved, and he lost his radio as well as his license for a period of time.

Moral of this story...

Although the law states that you can run wherever you want in an emergency, the Lord (FCC) giveth, as well as taketh away!

I operate almost exclusively CW and work a lot of traffic nets. The use of these codes is invaluable. My personal opinion is that their use should be limited to CW and HF-DX SSB. Saying QSL on 2 meters or 11 meters (local) doesn't serve much of a purpose.

Wrong!

The blue face and Black face are two Different amps, made by two different manufactures, the switches are different. and the design inside is different. and they're made in two entirely different states!

Hi all,

I don't know much about electronics, so I need help from you, the professionals. I have a 20 year old Teaberry 23 channel C.B. in my VW bus, and I can hear the engine rpm when receiving transmissions. I assume I need a noise suppressor of some sort, but what kind? I'm limited to stuff I can get at Radio Shack. Any suggestions?

Also, I've been told I can "tune" my C.B. antenna for better reception. How do I do that? It's a magnetic base type, again from Radio Shack.

Please respond via e-mail, because I'm not sure if I'll be able to find this newsgroup again. Thanx in advance,

James

I have one of Carl's meters and I have never had a problem, It reads right
with my 43 thruline carrier and modulated. The reflect while using the
remote lies.

Ground to the case.

Good luck.  The transistors that amp uses are just about nonexistant now!

Ok let me take a stab at this......

"R.J." wrote:

>   I have a few questions regarding antennas. First off is there an
> antenna available for use over a super wideband? Say from 23-31 Mhz, mobile
> or base?

For the Base, I would choose an antenna that has a gamma match. The Sigma 4 that I have comes to mind. The Sigma 4 is 3/4 long and is 32 feet long from tip to mount pipe. It is a very broad band antenna. In fact I had to use a 60 CH band spread and a modified export radio to be able to "see" the curve on either end. Mine is total flat in over the entire 40 ch band and rises only to 1.2:1 on CH60 and -20 I have never taken it farther than that so I don't know what the limits will be. I consider usable to be up to 2.0:1 with a low power radio. Add a good Antenna matcher and I bet you could get most of the freqs you want under 1.5:1...

For the mobile forget the Wilson's and most high gain antenna's. They are high Q antenna's. This means that they are designed to work better than most antenna's on a smaller band spread so they have more gain. In other words they work good over a small area but fall short in the band spread. Most Key down type antenna's are low Q antenna's. I/E Two watt, Muddy waters and DR. Crow. They are very broad banded antenna's. This is why the Reflected power usually drops allot when you use one. They are able to radiate more of the Dirty overdriven RF signal we get out of Comp style Class C battle boxes. Was this designed into the antenna? I don't think so.(ok, go ahead and insert arguments here guys..) I think it was a total accident. I hear people talking about how flat they tuned there comp style antenna's all the time. it is actually easy to do! Most don't have much gain at all. They handle loads of power and produce good results in the reflected power dept. so people run them. Most of the guys are running so much power that it makes up for the lack of gain you ge with an antenna like that so they don't notice. Just last week we saw this first hand. A friend has a van with 1500 watts of Xforce power. He switched out three antennas from a distance of 30 miles from my base. One of the antennas was his normal comp style antenna. the others ones where a Wilson 5000 trucker(highQ) and a $14 Francis fiber glass stick. Guess what? The lowest performer was the Comp style antenna! It has the best match and the lowest reflected power also... Next was the wilson 5000 trucker. A slight improvement over the Comp antenna. The winner: The $14 Francis. It had a lightly higher reflected power than both but it clearly got out better. I was worried about the power handling capability of the Francis but it ran ice cold with the 1500 watts. Wow a $14 antenna that beats two $100 antennas.. Oh and in case your wondering it was only a 5 foot Francis.

I would pick the longest key down style antenna with the largest diameter radiator that I could find for you purpose of the large coverage you desire. You will still need an antenna matcher to get the kind of coverage you want.

> I understand that antennas are built to have a sweet spot, but
> just how big can this sweet spot be?

The lower the Q and generally the longer/larger the antenna the larger the sweet spot.

>
>   This question is about SWR, particularly mobile. Most people have a
> reading that is high (1.4:1)

That's not high. 2.0:1 should be you limit not 1.4:1. you would never notice the difference in most case unless the test was controlled.

> on the ends of 11 meter, and low (1.1:1) in the
> middle. Others have a perfectly flat reading 1.4:1 across the board,

Mis tuned Low Q antenna. Or not enough ground plane and or bad ground with a low Q antenna. Another possibility is the radio that was used is dirty. I have seen Radios effect SWR Many times this way. A clean radio will produce allot of 27 MHZ signal and very little on t he harmonics. A dirty radio will produce allot of harmonics. This reminds me of a friends Sears Road talker 40. That damn radio is one of the loudest I have ever heard. With a few mods and a stock mic it is unpleasantly loud. My friend was trying to get his SWR's down but no matter what he did they would not drop. We changed radios out and he found that he had very little reflected power and a very good SWR. The antenna could simply not radiate the amplified harmonics that his Radio/amp where producing. This showed up as reflected power and SWR. I hooked the Sears up to a Spec analyzer and found huge spurs on the second and third harmonics as well as everywhere else! radios do effect the readings of SWR meters and reflected power watt meters.

> but
> can't get it lower than that. As an example lets say it's the same antenna,
> different car, but similar mounting; say a Ford van and a Chevy van, Wilson
> 1000 mag mounts in the middle of the roof, and even same radios. Why such
> different SWR readings?

Ground plane. The different vehicles might have different Ground planes to work with. Also you said mag mount. Mag mounts get there ground through the magnet.. One of the Vans might have a thicker gauge of metal on the roof than the other. It is also possible that one van may have many coats of paint. This would insulate the Metal from the mag mount to some degree. I have seen cases where a van might have a metal brace under the top. Moving the mag mount a few inches has changed SWR. I would expect the antenna to tune pretty flat on both Vans across the 40 CH band if setup right.

I hope this helps you understand antenna's more. Now for the arguments!!

The PC78 seems to be a decent radio however, it clips you modulation & Power. So far I haven't found any listed mods on this unit but I am looking. If you find them, please let me know. Thanks.

I'm a HAM (KB5UGJ), but my new job has me traveling over the road 3500-3800 miles a MONTH!

I'm looking for a CB rig to put in my mobile for these trips.

What suggestions does everyone have for a good (or the best) unit to get?

I'll be mounting it right next to my VHF/UHF (2m/70cm) rig.

Thanks and Later Daze

>   Only every post made....Including this one.

Gees Steve, It sounds like your a legend in your own mind.

>   You continue to make accusations that are obviously a fallicy to everyone
> else here. Your credibility is about zilch point squat.

A fallicy huh.........I love old trolls with new names. Let me clarify my "fallicies" for you Steve because you're obviously NOT comprehending something here;

An Antron 99 is $40 - A Diamond 5/10 is $190, which is a 470% price gain for an identical antenna (except for the frequency) THIS IS WHAT I ORIGINALLY POSTED, If you go back and actually read the posts, you may become enlightened.

A Wilson 1000 magnet mount mobile is $59 - A Larson 2 meter/ 440 maget mount is $132, which is a 200% price gain for an identical antenna (except for the frequency)

A Paradynamics 10-C SWR meter is $39 - The Diawa clone HF SWR meter is $105, which is a 269% price gain for the identical product.

I can name about 4 dozen more FALLACIES which come to mind without even looking for them.

How old are you anyway? My god cant you do basic mathematics, or at the very least, look at catalogs to compare prices.

>   I disproved your assertion with verifyable facts.

Verifiable with who? Only you.

> attacks...very professional. I am sure your Mom
> is proud of you.

Wow Steve, is that the best you can do?

>   No....I already provided references that shoot holes in your "500%"
claim,
> Windy. And the exchange between you and Toll even further proved me right.
Not
> even close to the "500%" you assert.
>
>   If you use the reference to the A99 (about $40 per your quote) and
it's
> "amateur" price of about $70, that's STILL not "500%". That's only
175%...not
> even close to your assertion. And NOT an unreasonable difference between
> retail dealers.

Hello out there.......are you on an ARES net somewhere? The comparison WAS
between the Antron 99 and the Diamond 5/10.

Steve Im glad to see you've got a new screen name however the new skill you
should be aquiring is learning how to read because you obviously mastered
that skill yet.

Hi all,

I believe that most of you know that Palco Electronics is the exclusive world wide Distributor of the Bulldog Meter. The Bulldog Meter is being built better than ever and is also selling better than ever before. People really like this meter and I am constantly being given compliments about this particular product that we sell.

Dave hit the nail right on the head with his posting. I and many other people find Carl to be exactly as Dave described him to be. Carl is honest, truthful and an extremely talented person. His integrity does not allow people to shout obscenities at him, he would just as soon hang up on that person and let it go at that.

Tony

It depends on what you want to do. If your looking to just monitor the highway any of the Unidens would be a good choice. The 66 or newer 68 is a good performer with a fairly small foot print. If your looking to try to use SSB or go to the outer channels the Rangers, Galaxies or the Uniden Grant with the channels expanded would be good. These are all bigger radios and you didn't mention what your vehicle was. A Wilson 1000 would be a good choice for antenna. I have used a Lil Wil on the highway with good results in highway communications.

David,
The old sayig goes "You get what you pay for" that is ever so
true
with the radio. Me personally have never ran the 225, but from
what I
hear from MANY people they are junk.#1 they are MASS produced,
that for
one shows that the quality would be less desireable. Now a
question for
you. Why would you want to run an amp on AM? #1 You will be

```
breaking the
       law, #2 your neighbors will more then lkely hate you for the RFI.
Now
       I'm not gonna' nit pic here at that cuz I have used an amp a time
or 2
       so I'm no hipacrit (how ever you spell it) In my opinion
David...try for
       a Texas Star or a DaveMade. You mght pay a lil more..but I can
assure
       you that you won't have too much problems with it. (as long as
it's
       hooked up right of coure) Good Luck
       73's

The equation is simple. Peak divided by 4 equals average (aka RMS).
If he's seeing 200 peak watts, then the maximum deadkey that won't
result in backswing with modulation is 50 (using a scope). Using a
Bird, it's the peak divided by 3 equals the RMS figure. In this case,
using a Bird, the RMS wattage is 67.

If you want more info, go to my website and enjoy the AM tutorial.

tnom@mucks.net wrote ...
>
>Then drop the QRT and say something like: "409 standing by"

Again, these codes are generally for CW use. When a station wishes the other station to "Stand by" they will send the prosign AS DiDahDiDiDit as one sound. If they are going to close the station and not stand by (on their end) they will send CL at the end of the transmission meaning "Station Closed", otherwise it is presumed that they will continue to receive traffic or calls from other stations. (IOWs, be standing by)

Generally QRT is used in conjunction with a phrase. Example: Must QRT for dinner or Must QRT for school, etc. This means "I must stop sending now, I have to eat dinner" and so on.

Hope all this has helped clear up this QRT thingy :-))

Regards,

Arnie -
KT4ST

> yes 30 watts am rms and 100 watts ssb on my rms meter. should have been more?
> not interested in peak readings.

     The 225 will do more than that in an average installation.
     Since the 225 draws very little power, the supply voltage
     doesn't droop.  That means the supply voltage under-load
     to the 225 will be between 13.8 and 14.5 volts.

     Given that, the peak wattage will be in the 120 to 150
     range MINIMUM.  Divide that by 3 to get the RMS wattage
     using a Bird.

     In many cases, the high under-load supply voltage will
     result in peak wattages that are in the 180 to 225 range.
     Divide that by 3 to see the RMS wattage as shown using a
     Bird (60 to 75).

     In any case, your 30 watt figure is unrealistically low.

UPON WHICH PUBLICALLY ACCESSIBLE RESOURCE ARE YOU AND WINDY ONE MAKING THE ALLEGATION THAT AMATEUR RADIO EQUIPMENT IS PRICED UNREASONABLY?

It's a simple question, so I imagine simple minds should be able to answer it!

Got **YOUR** dancing shoes on, Toll?

Steve Robeson

The Antron 99 at Copper:
http://www.copper.com/online/box.cgi?name=A65-00002&add=Add+To+Order 37.99

The Antron 99 at AES   http://www.aesham.com/sol.shtml 64.95

Steve,

Do you need anything else.

No, I am not taking my ball and going home. You seem to forget that I was the person who said that I was not responding any longer... Then, you put up a challenge, which I have answered.

You seem to be the person (who, to this day still hasn't) been able to substantiate anything he says, either.

Please see below for my answers to your rediculous diatribe.

>Subject: Re: Local Radio Operator Questioned by Police
>From: "Toll Free" tollfree@bigradios.com
>Date: Thu, 16 September 1999 05:21 PM EDT
>Message-id: <NhdE3.5524$C3.34020@insync>

>Funny.... You completely dance around the subject at hand, but seem to think that the rest of the newsgroup is fixated around the 500% claim.<

(1) There is NO dancing around ANYTHING, Toll. Windy asserts a 500% inflation in the price of communications accessories sold to hams vs CBers, and I say he's full of it. And I proved it.

>>>Where? I didn't see it anywhere? Seems to me that you said "That isn't true". I see in another portion of the thread where Wildcat reiterates his claims (yet again). I have yet to see you post to it, so I can only guess that you haven't seen it yet. Other than that, I have agreed with you that the inflation number is high, but I agree with him that it does exist.

Or, are you going to tell us that the aluminum used in an amateur antenna warrants a higher price because it is of higher quality aluminum than the same material when they put it to use in the commercial or amateur field?

(2) I have no idea what the "rest of the newsgroup" is fixated on, nor do I care. If they wish to participate, they may do so. If they don't, relief is just a mouseclick away. So far though, it's just you, Windy and I.

>>>>Oh, I believe that I do. I have been around a lot longer than most any other person on this group, and I would tend to say that they are all tired of you making an idiot out of yourself and keeping the thread going.

On the other hand... I guess we all need a good laugh, and now that Chuckie has a job and has become (no offense to you, Chuck....) a productive member of society, we can all look forward to your backwards thinking posts.

After all, the thought process is the same.... You just use cleaner language!

>100 percent price difference is an OK difference just because of different dealers?<

And I guess you have never paid $1.00 for a small Coke at a concession stand in an amusement park or $2.50 for a draft beer at "the game"? Come on!...The market will bear what the consumer is willing to pay! And if someone is willing to part with $500 to $1000 without shopping around for the best deal, well, the old addage about a fool and his money being parted is true.

>>>But, AES, HRO, and most of the other "Cater to hams" stores all seem to sell the Antron (since it has been used as the reference for a while) at

about the same price, but when you look at a CB (supposedly, although it seems the boys in Ky are looking to branch out) shop, the same items are less...

I have noticed it with the Maco products, too...

Call Joe Gunn and ask them for the two different catalogs... The same antenna is higher when you look at the 10 meter versions. Same construction, but higher price!

>This is a real issue, and as far as I know, the ENTIRE issue? While Wildcat
did make a rediculous claim of 500%, you have continued to skirt the issue that he brought up with it, and the price fixing that happens among the amateur
Vs CB market.<

Toll, are you on drugs?

>>>>No. You must be... The simple truth is their, and it seems something is fogging your vision. That, or you are a dunce.

Price fixing?!?! HAH!

>>>>I used the word as a metaphor. Still, seems funny that the Antron at a store that caters to amateur ops is higher than at the same type of store that caters to CBers...

What would you care to call it? I also seem to remember a case a couple years back about some pharmecuetical companies that had the same problem... They where fined for price fixing.

Guess my metaphor was right on, anyway. Need a dictionary?

I can pick up any CQ or QST and spend an hour on the phone getting quotes
on any particular piece of gear and get just as many different prices!

>>>>But, they will all be in the ballpark. I know. I checked. The Antron was within 10 dollars at the three amatuer stores that I checked.

It was about 50 percent less (give or take) at the CB shops (both local and internet).

Guess you are wrong again... Seemingly, I think that you will forget this comment, and all the rest of the proof that I have made for you when you go to write the next chapter of your bullshit story guised under this thread, though.

Likewise, I can find a Cobra 148 at truck stops for the same 175% difference in price vs dealers like Copper that the Antron "for instance" reveals. I have seen them for as much as $250, when the truth is they can be
had for far less!

>>>>>Ahh..... But, now you are not comparing apples to apples, you are comparing tangerines to tangelos.

A truckstop is not a mailorder discount storefront. A truckstop is a truckstop.

Why don't you look at the price of a Grant XL at AES and then at Copper (since they are both mail order (more or less) and cater to two completely different license classes) and then report back to the rest of us.

Wait.. That would be disastrous for your end of the stick. You would be proven (yet again) wrong.

So what about THAT price fixing, Toll?

>>>>yadda, yadda, yadda.

>Put up, or shut up. The thread, as well as you, have wasted entirely too much
bandwith!<

So, confronted with the challenge of providing a bonafide reference to the
ALLEGED price fixing, ie: a catolog reference, etc, and UNABLE to face up to the challenge, you, like the little boy on the school yard who is getting beat
at basketball, wants to take his ball and go home?!?!

>>>Nope, seems like I did a fine job. I have included posts that will hyperlink you to the exact pages, so you can concur for yourself, as well as put the prices in the post. Should make it a little easier on ya.

I DID put up, Toll....I don't need to reiterate for you or anyone else that which is archived here.

>>>>No, I believe that you do.... Because obviously you have missed the point entirely.. And now choose to chase a ghost of something that only you are looking at!

NOW...

UPON WHICH PUBLICALLY ACCESSIBLE RESOURCE ARE YOU AND WINDY ONE MAKING
THE
ALLEGATION THAT AMATEUR RADIO EQUIPMENT IS PRICED UNREASONABLY?

>>>>Please see the posts above.

It's a simple question, so I imagine simple minds should be able to
answer
it!

>>>EXACTLY... Which only makes me ask one question??? Why haven't you
gotten it yet? The rest of us have...

Guess simple minds can't get it then, can they?

Got **YOUR** dancing shoes on, Toll?

>>>>Tap, Jazz, Ballet and modern. What style do you prefer?

Toll Free
Dancin' the night away!

Steve Robeson

I agree.

I hate to be the one to say it, but 2-IR-082, you're SOOO wrong
in just about everything you say. You should realize that you
really have no clue about how CB really works.

What you've failed to understand is that the common operator knows
to hum, speak, or whistle a steady tone into the input of his SSB
transceiver when he's looking for a peak wattage number.  When the
ALC is disabled, the output waveform under those conditions will
appear to be a constant carrier (at a constant amplitute that's
easily measured).  Under those conditions, an average-reading
meter will show a peak figure since the waveform looks like an
AM carrier.

If you don't believe me, secretly go to my website and read the
reasons why all wattmeters are wrong.  From there you can justify
any argument.

Bill,

You can actually do the proof and find out the the PEP/(2.828*1.414) = RMS, and PEP/2.828=AVG.

Since the PEP/2.828=AVG, and the RMS value of an AVG component is 1.414, it actually comes out to PEP/3.998792.

The Bird meter is an averaging type wattmeter. A calorimeter type meter would give you the RMS value.

Hope this helps to get the others to understand.

Toll Free

The other thing you can do is inject a carrier of equal strength as the maximum PEP value that the radio is capable of, and that will give you the saturated PEP output of the amplifer.

Since the carrier PEP is the same as the AVG, the two numbers are identical.

This makes it even easier. Crank a 20 watt carrier into your linear, and you know how much it will PEP on sideband!

mudduck , why don't you take it to the other one, we of the am variety could care less about slimeband activities, needless to say you idiots sound like a a bunch of ham radio want-a-bees and besides that you sound like you are talking from the bottom of a 55 gallon barrel which is probably par for the course. incidentally little bitty sucker , if i lived near your silly ass, you would not get out , not now , not never, like i said it is just a radio thang , so put that in your pipe and smoke it and remember the head said that he ain't never talked on channel 6 and never will , cause it jus bees that way somtimes, dig it , head out and back in the bushes...........

Very true, Hey Tim put your bird meter on an amp on am and get a reading
then switch over to SSB and get a reading, with a amp say a 5 pill you will
see a substantial increase in what wattage, but if you use bird with the pep
kit installed you will not see that big of a difference, the ssb reading
will hardly change from what you read on the averaging bird meter. Tim needs
a thruline with the PEP kit.

I would have to agree.I bought one about 1 1/2 years ago. Worked fine and was "ok" on accuracy till I bumped it with about 3 kw. It started acting funny. With about 5kw it burned up the line section.They are only using pvc for the insulater. If they really want the meter to handle a "true" 5-10kw they will need to redesign the line section using teflon and go with LC or type N connectors and not 239's.I can say that they gave me a refund and did send me another one to try but the same thing happend with the second unit. Just remember....there are no watts like "Bird" watts.....and your BigBamBoo is gone......

I love this stuff too. Roger, roger, Roger. It has got to have something to do with the mentality of some no code techs and where they are coming from. Locally here, we have a fairly active RACES group due to freqeuent severe weather problems. One basic rule is that you do not go out of your way to draw attention to yourself such as flashing lights and such. One of these guys, a less than professional looking outside salesman, bought a well used Suburban, had it repainted in bright colors SIMILAR to a police cruiser, and had EMERGENCY COMMUNICATIONS painted on the side, all looking quite professional. The light bar on the top was just too much though, and when he was caught running those lights during a storm event, he was drummed out very quickly. He loved to show up at activities wearing cammo BDU's.

Think very long and hard before you would ever consider buying a BULLDOG watt meter!! In the event you have purchased one recently have it checked for accuracy! The 2 meters I was subjected to were the biggest pieces of garbage I/we have ever seen!

I purchased one and it was so out of calibration it was ridiculous. I sent it back to the pathetic sob in Tennessee who manufactures the Bulldog. Thinking, well maybe I just got a bad one.

Of course he thinks he is the only one that knows anything about Watt meters and was very difficult to deal with. He sent a replacement after waiting 3 weeks. The replacement had a damaged meter movement and was as poorly calibrated as the original meter. His SWR meter funtion was as poorly calibrated as the rest of the meter

What a waste of time dealing with a arrogant, pathetic sob!

>OK, please post Diamonds CB antenna Line for us. You cant because they dont have one. Diamond, like many other manufacturers does not want to cater to CBers because they know CBers wont pay but Hams will. <

You keep changing the variables of the post, Windcat.

First you assert that the manufacturers are locked into price gouging because the "Hams" will pay top dollar for their gear. I pointed out that every major manufacturer has more than one outlet for it's products, none of which are "exclusive" to Amatuer markets.

Then you switch to Amateur vs CB. Apples and Oranges as always, but still I proved you wrong again.

Now you have it down to ONE manufacturer of Antennas that won't sell an 11 meter antenna, allegedly because they think they can gouge Hams for the "Big Bucks" (my emphasis, not yours)

>The same goes with Cushcraft, Hygain, and just about every other Ham oriented manufacturer that once had CB lines, of which all of them abandoned their CB products because of the justification of cost. If you're only 30 or less you wont remember.<

Here you go again. You started out arguing about the price of items like Henry and Alpha amps, now you try to make your point over antennas.

As for the arguments on amps, you can make the arguement that Alpha amps are, quite honestly, real big time bucks...and you'd be right. I've not priced an Alpha, but an acquatinence tells me I could easily drop $6000 or more into one.

But I can easily spend less than half of that on an Ameritron amp that will put out the legal limit and only the most discerning ear on the Ham bands would know the difference

Cushcraft and Hy-Gain STILL manufacture antennas capable of operation on 11 meters...the only difference is that you are going to have to search them out. And many of the antennas they DO make are sold under different lables. Of course they have a hard time competing with Asian import mobile and even some base antennas that sell for pennies on the dollar over their US counterparts...BUT you get what you pay for.

The brands you quote are built to MIL-SPEC standards in many cases, and are priced accordingly. You want quality...break out the gold card...you want cheap and quick, roll your pennies.

As far as the Comet and Diamond antenna lines, many of their Amateur antennas are built to very exacting specifications and even go as far as gold plated contacts. Do you think Joe-Average CBer wants to pay for that kind of quality in an antenna when all he REALLY wants to do is ratchetjaw around town or get occasional "Smokey Reports" while on the road?

>Yeah, right Steve, whatever you say. Are you going through Fred for your Vanity call?<

You think that paragraph was DEFENDING Maia?!?!

You ARE sick! The FCC may have sucked me in with the price drop after the first round of Vanity calls was issued, but I did fill out my own applications.

>This sentence doesnt make any sense, in English anyway. My god do you communicate in your QSO's in such a dyslexic fashion?<

If you think so, Cat. The problem is that if YOU had a hard time reading it, YOU are the dyslexic, not me. I would be willing to lend you my Handbook of Neurological Nursing. (Guess what I do for MY bucks, Windy?)

> That FACT and the POINT still remain valid, HAMs will pay more money for equipment and Ham suppliers know it. Maybe you
can explain to me how in an perfectly competitive elastic market a 2 Meter antenna that is identical to an 11 meter antenna (except for its length) should sell for 500% more money. Please post this explaination Steve (without the dyslexia).<

OK Wildcat...what would you like to compare? Moonrakers vs HyGain tribanders? The A99 vs the Hustler 5BTV? And what shall we use for a resource, Windcat? Copper? AES? HRO?

Since YOU quote the figure of "500%" increase in price difference, YOU quote me and this NewsGroup which antennas to which you refer.

Let me give you a couple "for instances" where you are going to look REAL DUMB, though:

Radio Shack 2 Meter Mag-mount mobile antenna: $39.99
Radio Shack "Deluxe Mag Mount CB Antenna" $38.99

Oooooh...ONE WHOLE DOLLAR! Let me get an equity loan for THAT!

Radio Shack 2M/70cm Thru-glass antenna $39.99
Radio Shack 11 Meter thru glass antenna $39.99

Zingggged again, Cat...."0" difference!

So WHERE is your "500%" price difference, Cat?

As for the "perfectly competitive elastic market", I guess you haven't been to too many Hamfests...I see hundreds of people walking around haggling price, even over the smallest components. Hardly the "willingness" to pay high dollar, Cat.

The present 144/440MHz antenna on my car cost me a wopping $15.00. And that was NOT a "sale" price. It was bought cash-money from a retail dealer.

I could go on and on, and quote from a dozen different catologs, but since YOU are asserting the supposed "500%" inflation, YOU provide the references on where you are getting you information from.

Is that plain enough for you, or would you like it in Braille?

Steve

>Back before the government do-gooders banned the sale of metal CB antennas, Cushcraft marketed a "Ringo" CB antenna. It was a vertical half-wave, 3.75db gain, and sold for around $35. The SAME EXACT antenna was marketed to hams as a 10-meter vertical and sold for $55-60!<

Since WHEN are "metal" CB antennas banned, Enforcer? And I think you would be hard pressed to find that same price disparity today.

Certainly, you can ALWAYS find someone who will try to sell you something for more than someone else will, but then it's YOUR money and YOUR responsibility to shop for the best bargain.

>In fact, the same thing occurs today with the Solarcon A-99. Copper sells it as a CB antenna for $39.99. AES sells it as a 10m antenna for $64.99. Which

would you choose?<

Good point, and exactly what I said. You pays your money, you takes your choice. That's why all these dealers have tollfree (no pun intended!) phones.

>I can see a ham radio dealer lauging somewhere. :) <kaching $$$>

When one considers that CB accessories outsell Amateur accessories 10 to 1 easily, I would say that the prices of the Amateur gear are quite reasonable.

OR...the CB prices are grossly inflated since they (the dealers) can sell 10 more of the CB antennas than the Amatuer antennas at the same price...

So WHO is gouging WHO, Boys?

This is the reason a lot of the guys that cb stay at cb, at least until they
can walk in and pass both parts of the general class exam. The 2 meter band
is where all of the nerds from the cb end up!

> Since WHEN are "metal" CB antennas banned, Enforcer?

I believe the CPSC banned their sale and manufacture in the early 80s. 1983 or 1984. Anyone know for sure?

At the time, my local Radio Shack had a supply of their "Archer 5/8 wave base antennas" on hand. They clearanced them for $6.95 each. I bought all 12 and sold them individually for a handsome profit! Reason for the low clearance price was because they had to get rid of them before the CPSC do-gooder law went into effect.

For some strange reason, though, beam antennas were exempt from the ban. Anyone know why?

>New England area and all of the GI Joe Wanna Be's are out in full force.
Here's what some of these guys are saying and doing:<

SNIP!

I guess it's useless to waste bandwidth to point out that most Amateur stations involved in public service communications must usually pass traffic in a manner the served agency finds understandable.

I won't argue the fact that "plain English" would be just as easy, but since you took the time to make the swipe, I thought I'd burst your bubble a bit.

>They are actually using words like "that's affirmative" instead using of the word "yes".<

As opposed to "Tenn-rogaah dee" on CB?

>Saying 0700 instead of 7 o'clock.<

Actually, in moast of the world outside the US, the 24 hour clock is the standard, not the option.

>Calling their club meeting house the "Command Center".<

Actually, if you read most FEMA or Red Cross disaster manuals or deployment plans, that's what THEY call it, and it's their show.

>Instead of saying "Can we send a couple to guys over to the Hospital for a pickup?", they're saying "Can we mobilize several units to MED 1 for a transport".<

Supported agency communications. Quoted out of context by someone with an axe to grind, I would say.

>Most of these guys are feeling the need to report every 5 minutes in what direction the clouds are moving and what color the sky is. So far this morning I've heard that the sky in the same location, at the same time was 7 different shades of gray.<

Did I miss something, or isn't that what SKYWARN was created for...?!?!

>Two guys were actually arguing about which one of them was actually the "Incident Command Team Leader"<

A regretful place to do it, but the ICT is a valid FEMA designation.

>And finally, one Ham is leaving his home for his club headquarters 12 hours before the storm might hit because he's afraid the storm might hit and he'll be trapped with his wife with no utilities for 5 days. ;-)<

What's the beef? I wouldn't want to be stuck with no utilities and your wife for five days either.

Steve

As long as they are wrong the same everytime you can still use them to check for changes and make adjustments to your equipment or to compare one item to another.Since almost every brand of meter shows different readings anyway this is all we can hope for...Its only when they show something different everytime you use them that they become worthless

To fix the oscillation completely change r 159 to a 100 ohm. This resistor is
next to the 2166 driver
what this will do is increase the negative feed back to the driver there will be
no power loss and will not change any tuning. This fixed mine and two others
completely. I would leave the caps on the finals..

> reading that is high (1.4:1) on the ends of 11 meter, and low (1.1:1) in the middle. Others have a perfectly flat reading 1.4:1 across the board, but can't get it lower than that. As an example lets say it's the same antenna, different car, but similar mounting; say a Ford van and a Chevy van, Wilson 1000 mag mounts in the middle of the roof, and even same radios. Why such different SWR readings?

First off 1.4:1 is not a high reading,in fact it is a very low reading.

bandwidth with a vertacal is a result of the elements length to diameter ratio,build a whip out of 1/2" copper pipe!

different cars present different ground plane characteristics.

1. Listen before calling

2. Make short calls with breaks to listen

3. The usual procedure of a QSO is to give a signal repoirt and tell your name and location. Make reports honestly. Give data conciesely in first transmission.

4. Check transmitter adjustment. Avoid splatter. Keep modulation constant. Don't ride the microphone gain. Keep the gain down and do not whistle into the microphone.

5. REMEMBER : The QSL is considered as the final courtesy of a contact and is an amateur radio tradition. If you want a QSL from your contact, send him/her a

card. And as a matter of common courtesy, send a card ov everyone who sends you one.

6. Never break into a conversation. Always wait until both operators have finished, even if it takes one hour, and even if it means you loose the contact. It is ok to announce that you are on the side (once only).

7. If you hear someone calling for a particular country or particular station, unless it is your county do not answer. Please wait one minute to determine if the station calling has made contact with the station or country he has called for. If you do no hear a contact made, then try your call for him.

8. Send QSL cards only with the permission of the station contacted!

9. Don't repeat on the radio the QSL address that appears on the directory

10. Say the callsign once, after that repeat only the unit namber without the full callsign.

11. Don't write unit number or callsign on the envelope.

12. Don't use the 555 for QSO because it is an internation call frequency !

There are a lot of most wanted countries in the world. In many of these countries, most of them are islands, don't live any 11m DXers or they are QRV sporadicly only.

Some of these countries were activated by some enthusiastic DXers, who visit such a country only to give the rest of the world a chance to make a QSO. Other DXers take their radio on holidays to every country and activate a holiday station.

Usually a DX'peditions is temporary and has a special callsign (e.g. "�" - first activation, or "DX" for the 2nd, 3rd activation)

Usually they give as QSL information a callsign or the whole address of the QSL Manager every few minutes between their contacts. QSL Managers are used because the QSLs will be mailed from another country.

DX'peditions stations are interested to work as many stations as possible and on the other hand nearly every DXer want to work the most wanted countries. To handle so many stations, they give out a progressive number for every QSO.

You can believe that the costs for mail and the special QSL cards are extremely high, besides the cost for the journey is high enough. That is the reason why you have to add $1 US or 2 IRCs as contribution for your reply card.

The same applies also for stations in most wanted countries. They demand for a small donatation to reply their cards to you. Imagine they certainly have thousands of QSLs from Europe and America, so they are not really interested in your card, but you want to receive his/hers. So help these operators with the mailcosts for that they keep active and keep QSLing.

If you want to work an interesting station or expedition, you need a different behaviour than for a normal QSO.

1. As soon as you know that the DXpedition is activated, look for it (internet clusters) at the usual time to copy that zone or continent

2. Listen carefully in the frequency before you make the call

3. Before you contact a DX'pedition, listen carefully for the callsign and the QSL information and try to find out the address of his manager instead of constantly asking. If you ever had the chance to do an activation you know how annoying it is to get asked every few minutes for your callsign or your address.

4. Make short calls with your callsign only (or even only unit number). DX'peditions are done by experienced operators that know which country belongs to which prefix. If you get being called by the team, confirm your callsign and the received progressive number. Add maybe signal report and your name (depends on the pileup).

5. Never give your address to a DX'pedition, you only produce QRM.

6. Some expeditions are a working with lists, that means they listen carefully and write down the callsigns. If they acknowledge your callsign, you shouldn't call anymore. If not and the list is complete, wait until they start another list.

7. Be a gentleman and standby if someone else is talking to the team. If you do not disturb the exchange of the details, the expedition can continue more quickly with the calling stations. Please remember that some expeditions have blacklists of operators with bad behaviours who will not get a progressive number!

8. Send your QSL as soon as possible including progressive number (!) and your return address. Do not forget the required contribution and add a Self-Addressed-Envelope (SAE). This will increase the returning time.

Yes, it definitely works in some situations, and it does boost modulation a bit, which is helpful since I only get about 70-80% max with the 45HH (didn't find a modulation mod for this on the web). Don't expect to hear weak signals all of a sudden that you weren't able to hear before w/o ST on. In my experience, it's only useful for clearing up those you can already hear quite well...

Thanks for sharing about this. Perhaps if he can't sell his product he will figure out that it needs to work properly and he needs to provide proper service. Have no idea what you paid for this but you probably get what you pay for. Even if it is consistently incorrect, it is no replacement for an accurate meter and if he advertised it as being reasonably accurate, that is what he should deliver. Would love to see his advertising for this--"Consistently Inaccurate!"

Quite honestly, This is the first person to complain about Carl's product.

I have used one, and although they are rated to 10Kw, I wouldn't use one past 5Kw. Prime Minister has said the same thing, on this newsgroup. I tried one, and after about 6.5 to 7 grand, it got screwy and finally failed.

Other than that, they have proven to be a good meter in everyday use. Maybe the quality has suffered lately, but you honestly have the first complaint I have heard about them!

I pulled the mod limiter out of both the radios.

One only keys at 4 watts. The other guy wanted his to key at 5.

Toll Free

If you have never used one then why the comment?
I used one for years and found it to be a good little amp.
I heard this; someone I know; etc.. doesn't quite answer the man's =
question, now does it?

Anyone,

The Palomar 225 will produce
200-225 am, 225-250 ssb and they
do not run hot. If you experience
this problem primarily on am, you
have the carrier (deadkey) set too
high in the radio driving the amp!

Jack

One of the problems SKYWARN net controls have is getting people to shut up and just report what is necessary. Reminds me of the SKYWARN net that was up and the net control ask for stations to report "minimum reporting criteria only". He repeated this several times to emphasize he wanted only "minimum reporting criteria". If you don't have that, shut up. Next thing heard...
station..."kxxxx"
net control..."kxxxx go ahead"
station..."we're out here on Sketter road just north of Petticoat Junction and looks like lightning may have struck a tree out in the middle of this pasture........no damage, kxxxx out."
net control....."Sheeesh"

Some guys just can't stand it unless they can make sure they are heard on the net, the fact they have nothing worth reporting dosen't stand in their way.

This is not an equation, and it's the variables "OF" the post, not "TO" the post.

> First you assert that the manufacturers are locked into price gouging
> because the "Hams" will pay top dollar for their gear. I pointed out that
> every major manufacturer has more than one outlet for it's products, none of
> which are "exclusive" to Amatuer markets.

Yeah...........and.........

> I proved you wrong again.

You did? I must have missed something somewhere. What posting was it that
you proved me wrong?

> Now you have it down to ONE manufacturer of Antennas that won't sell an 11
> meter antenna, allegedly because they think they can gouge Hams for the "Big
> Bucks" (my emphasis, not yours)

Excuse me oh dyslexic one, I mentioned manufacturers as an example. I can
name about a dozen more if you like.

> Here you go again. You started out arguing about the price of items like
> Henry and Alpha amps, now you try to make your point over antennas.

]
Look Steve, both myself and the rest of the group are still waiting for your
explaination of why a Ham antenna is 500% more than a CB antenna. Amps,
antennas or accessories, its all the same. Its been two postings since I
asked this of you and all you've done is retort with some redundant babble.
If you're going to post a response, please use some intellegence will ya.

I love to debate people however I wont engage with someone who's shooting
blanks. You must be a real popular guy on 20 meters.

30 clean RMS watts not peak or anything like that and it was run at 12 volts.
yes 30 watts am rms and 100 watts ssb on my rms meter. should have been more?
not interested in peak readings.

I need the transformers out of a 12 tube phantom.  Got an old phantom
with week tubes?  I will buy the whole thing or just the transformers...

FYI,........

An am signal consists of a carrier and a pair of sidebands, upper and lower....

An ssb signal consists of a single sideband with the carrier and the remaining sideband suppressed or removed....(filtered)

The instantaneous power levels involved with any mode of operation which uses one or more sideband components can only be ACCURATELY measured with a power meter that is able to respond fast enough to "follow" the power levels contained in the sidebands, as these levels are of relatively short duration, corresponding directly to the use of consonant and vowel sounds in human speech!

RMS, Average or "Heating Power" readings are fine for checking unmodulated am carrier levels or fm transmitters. In both modes, both am and ssb, especially on ssb, voice peaks sometimes rise as much as 2 - 3 times above "baseline" audio levels. (varies with individual voice characteristics) What we are failing to understand here is that these peak levels occur in literally fractions of seconds, making accurate readings with equipment designed to measure RMS or average power

absolutely impossible! EQUIPMENT OF THIS TYPE
DOES NOT RESPOND QUICKLY ENOUGH TO "READ"
POWER LEVELS OCCURRING IN THESE SHORT PERIODS
OF TIME, which correlate directly to variations
and patterns of individual human speech!
....

Jack

>> I proved you wrong again.
>
>You did? I must have missed something somewhere. What posting was it that you proved me wrong?<

Only every post made....Including this one.

>Excuse me oh dyslexic one, I mentioned manufacturers as an example. I can name about a dozen more if you like.<

You continue to make accusations that are obviously a fallicy to everyone else here. Your credibility is about zilch point squat.

I disproved your assertion with verifyable facts.

You respond with personal attacks...very professional. I am sure your Mom is proud of you.

>Look Steve, both myself and the rest of the group are still waiting for your explaination of why a Ham antenna is 500% more than a CB antenna.<

No....I already provided references that shoot holes in your "500%" claim, Windy. And the exchange between you and Toll even further proved me right. Not even close to the "500%" you assert.

If you use the reference to the A99 (about $40 per your quote) and it's "amateur" price of about $70, that's STILL not "500%". That's only 175%...not even close to your assertion. And NOT an unreasonable difference between retail dealers.

Until you provide a verifyable public source (a catalog, paper or on-line is certainly suitable), you are exaggerating at least, and lying at worst.

>Its been two postings since I asked this of you and all you've done is retort with some redundant babble.<

Uhhh....YEAH....Right.......

I have provided VERY specific reference to prove you wrong. You simply keep bantying around this alleged "500%". YOU have yet to prove your assertion.

>I love to debate people however I wont engage with someone who's shooting blanks. You must be a real popular guy on 20 meters.<

FACTS, Windcat, FACTS.....WHERE is this "500%"?? Your imagination does NOT count.

>If you're going to post a response, please use some intellegence will ya.<

The only question of any intelligence deficit on my part is expecting that you will produce any of the references that have been asked of you.

No....I already provided references that shoot holes in your "500%" claim, Windy. And the exchange between you and Toll even further proved me right. Not even close to the "500%" you assert.

If you use the reference to the A99 (about $40 per your quote) and it's "amateur" price of about $70, that's STILL not "500%". That's only 175%...not even close to your assertion. And NOT an unreasonable difference between retail dealers.

Funny.... You completely dance around the subject at hand, but seem to think that the rest of the newsgroup is fixated around the 500% claim.

While I also feel that the claim is rediculous, I also find your statement copied above just as ludicrous.. About the Antron. 40 dollars at a CB store, 79 dollars at a ham store.

100 percent price difference is an OK difference just because of different dealers?

I guess you would pay $40,000.00 for a car just because when the rest of us are enjoying the same car for $20,000.00?

This is a real issue, and as far as I know, the ENTIRE issue? While Wildcat did make a rediculous claim of 500%, you have continued to skirt the issue that he brought up with it, and the price fixing that happens among the amateur Vs CB market.

Put up, or shut up. The thread, as well as you, have wasted entirely too much bandwith!

You should be interested in the peak readings.

Peak Envelope Power is the correct way to measure an AM and SSB signal!

modify to what?
at 1/4 or 1/2 watt you'd be lucky to do any better on 3 AAA cells.
as for channels, look at the crystal and see which harmonic it operates on.
3rd, 5th, 7th etc.
decide which channels you want.
if they are within the tuning range of the radio, figure out what the difference is and figure out the crystal freq will be.
example, if you want to jump 10 khz, and the crystal is a 3rd harmonic, add .333 to the crystal in it to get the new frequencys.
when you order the new crystal, be sure to take the new freq out to the last decimal place as the old one.
if the old one is XX.XXXX, take the new one out to 5 decimal places or your new freqs will be off by a multiple of the error of the new crystal. i know of no pll mods though.
by the way, how about some more of those world famous jokes??? :):):)
jeff

P.S.
i don't want to hear any shit from hams on this because a ham with his numbers posted on the rec.radio.amateur ng asked almost the same question 2 weeks ago only he wanted to modify his HIGHER POWERED AMATEUR EQUIPMENT for frs freqs. so keep it to your self.

jeff

Below is what Copper Electronics advertises about the ABS-1600. However, I was wrong, the max. frequency of this antenna is 28.5 mhz, not 30 mhz as I previously posted. It still isn't bad though, 1.9:1 over 2.5 mhz.

ABS-1600
#S60-05066

Shakespeare ABS-1600 Base Antenna
Built to Military Specs
Power, 4000 Watts PEP ICAS
Bandwidth, 26-28.5MHz at 1.9:1 or Less
Relative Gain, 12.5 dBi
Length, 21' NOM (3pc) (UPS)
Electrical, 50 Ohm Coaxial 5/8 Wave
HV Protection, 14.5 KV
Mounting, 2 U-Bolts Supplied

C.O.D. Price: $ 79.99
Credit Card Price: $ 79.99

You are definitely in an minority Bill. There are guys (Hams) up around
where I live that wont even admit on the Ham bands that they even own a CB.
Sometimes you'll here them say something like "Charlie, Ill talk to you on
the *other* band"...................

Do they still make the Sigma antenna?

PS: I run a $15 7' 10k Nightstick that totally agrees with your mobile
antenna comments.

It's a real shame, Windy, that you have to act like this. THIS is the very same stereotype that people perceive as being "a CBer".

I don't mind telling anyone that despite almost 3 decades as a licensed Amateur that I am still on CB. But people question being on the air with "all that profanity and childishness".

I tell them it's just a vocal minority.

Sometimes, I wonder.

I guess another reason is because some HAM OPERATORS are upset that the FCC
took it away from them. Also what about these goverement frequinces? I mean
this is a no no frequincy for anyone except goveremet people. So if this is
true then why not do the same for CB RADIO? I mean HAMS do not want CBer's
on theire frequiencies talking CB RADIO I do not think, so why come down on
11 meter band to mess it up. I know NOT ALL HAM & CB OPERATORS are bad, it
is only a few who mess it up for the rest of us.
>

Right, just like some CBer's who go to 10 meters who mess hams up.

Your right. I am wondering if I am letting some of these no good people get
to me & talking it the wrong way. I thank you! Your ringht there is nothing
baring hams or anyone from doing what ever. I am sorry!

Yes, but why do people from ham or say they are come on CB & messed it up,
or was it non hams who messed it up by cussing.

You idiot.

Cussing didn't "mess up" cb radio. A multitude of things "messed it up"... And their are people out their who say it isn't messed up at all.. I tend to agree that their is something wrong, but no matter what town I go to, I can always find a clean conversation (although maybe a lot of arguing) on channel 6, and if I just want to talk to someone, I find a good SSB operator.

CB radio is what you make of it, Pee Wee... However, I gather that you are unable to make anything of anything in life due to your Pee Wee sized brain!

The people who messed up CB radio where the ones that where overpowered, foul-mouthed slack-jawed, slope-browed, inbred, cornfed, and uneducated!

Look in the mirror, 10-4 good buddy.

This is Toll Free, and I'm 10-10, Listenin' in!

You could get a ham hf rig that's modified for 11m (illegal but works), but
if you are going to be spending your time on ch.19 AM, a good cb will work
better (most of the newer ham rigs suck when it comes to AM transmit audio
and noise-blanking). The Grant-XL and PC76 were good suggestions and for the
little extra money, you'll probably like the Grant so you can do some
yakking on SSB. Good luck!
Woody

How can I tell how much amperage I would need to run a small linear - 200 watts on low occasionally, with a VC 100 also hooked upt to it? The VC takes just 1 mAmp or less.

I will be going to CB@one list were it is legal (100%) & it is not full of cussing or has & trash like it is here. I tried this one & for the most parts some people have cussed @ me & said things that said I was metal. I just do not like seeing a good hobby going bad. You all say ham is good & it may be & some parts may be 100 worse. I wish you all would smell the coffee & grow up! On one list it is legal so if you want to join me then 10-27 your self to the good legal side of CB RADIO & go to http://www.onelist.com & become 10-8 on there. There it is no cussing & family like it was.

Please read all of this post.

1. I have a WORKING Realistic TRC-458 which is a 40 channel CB base
AM/SSB radio that I am selling for a freind. The radio is some
scratches and a bit dirty, (belonged to a smoker). Has NEVER had any
extra channels put in it.
Great radio, as it can do over 200 channels. Info on the net. It has
the 858 chip.
Full service manual included (a $ 25.00 value)

2. A TRC-449 mobile CB radio (same board as the TRC-458) for parts.

3. A Radar Detector, manufactured in the 70s (working the last timre
I used it before the law changed).

4. A Kenwood KSC-4 battery charger (working) with service manual.

I am asking $ 125.00 + shipping for ALL . Items sold as-is, radios
have no mikes.

Please reply to email as I do not often get to this newsgroup. He
want to get this stuff sold ASAP, so please reply ASAP. I will reply
to you Monday to Friday only.

Thank-you,
Greg

I dare say that 90% of the hams today don't even know that 11 meters was once a ham band and the 10% that do know could not care less that it no longer is.

You should have addressed this as...

CB GOLDEN SCREWDRIVER KIT FOR SALE.....

That would have made a better subject line.

Toll Free

Just like you had to put your two cents worth in and be demoralizing, huh Steve?

Can't leave well enough alone, can we Steve?

Funny... I love the people who come out here and belittle people for belittling others!

Practice what thine own self preaches, grasshopper!

Toll Free

What is this immense hang-up you seem to have about cussing. I remember you as Pee Wee on one of the internet CB Message boards and everyone got tired of your tirades on there and you eventually left.

As the Eagles said in their last album, GET OVER IT. If you don't like the cussing or other ways people operate their radios, change the channel or turn it off.

And since you are going to the CB list at onelist, I suppose you will be going 10-7,,,,AGAIN!!!!!! Sheesh.

Dave

Boy, I agree that if he only gets 30 watts he has a lemon or a bad meter. It has been many moons since I installed my 225 but I remember that I was getting over 150 watts on high - it may even have been 170 watts. Maybe he has the switch on low power and that would make him in the right range.

Moondance.

I have a Grant XL and a Galaxy 225, which I have been told is the same amp as the PAL. I have had zero problems and have been told that the system is very strong and clear. It works very well on SSB too except for the delay. You get used to it though. I got mine from Exports R Us and was happy with the service. Say hello to Steve.

The other thing you can do is look for a Maverick (their is one on E-Bay with new tubes for less than 200 bux), PDX-400 or any other 4 tube or more D & A amplifier.

If worst comes to worst, I might have a transformer here that would power the entire unit with just one.

Let me know... The one I have I won't let go cheap, either.

The broadcast band for your home stereo FM is Wide-FM - Public service radios are narrow FM and Aircraft use AM as well as the CB band - They are just different types of modulation. Wide means a wider bandwidth so your music sounds good on the FM Broadcast Band - public service radios dont need high quality and it takes up less room in the radio spectrum - AM is used on aircraft becasue it can be heard at greater distances than FM - FM is a close range mode and AM is more for med-long range.

FM is created by slightly changing the frequency with the persons voice audio.
AM is created by changing the power output to the persons voice audio.

Toll Free,

  So let me see if i have this right....
You want me to subject a pair of
mrf455's to 30 watts of carrier.........

 "The other thing you can do is inject
a carrier of equal strength as the
maximum PEP value that the radio is
capable of, and that will give you the
saturated PEP output of the amplifer".

  (The 148gtl that I use will produce
30 watts pep)

  With 6.75 watts into a pair of 455's
I am already seeing 110-120 watts out..
At 8 watts in we are seeing 180 watts out!

  Which is really interesting....the 2 455's
under test are (each) marked 88 watts with 4 watts

input from the people at rf parts....guess
my dosy can't be too far off!

All I can see is that if I follow your
advice, what I will be left with is 2
pieces of ceramic "toast" with some silicon
jelly in the middle of both!

I can already say with a great degree of
certainty what the outcome of this hypothetical
test will be if carried to your suggested
conclusion! No Thanks........................

Jack

Hey don't worry about Mr. Door Knob, he's
just jealous that you can do the things
you do, and he can't! He's just another
disgruntled ham/cb operator that whines
about everything. Since we have his address
we should send him some cheese to go with
that whine......... Limburger preferably ..

does someone need 500 watts to talk to someone near?
granted, there is an abuse of power on cb and the out-bands.
this is why i advocate a no-code license in a segment of the out-bands for our
experimental use with a 200 or 300 watt limit and better enforcement of rules
and limits associated with it should it ever happen.

Jack,

No, you don't have to subject your amplifier to 30 watts of carrier.

Inject a single tone on SSB.

Look at it on a scope.

What do you have.

A carrier!

And if you are doing it for just 5 or 10 seconds (for the sake of testing), then you hurt nothing.

I have driven a quad of 455s with 100 watts PEP, and it did nothing to hurt them.

Thats 25 watts a piece!

So, I don't think that you really have much to worry about.

Toll Free

CB. 27 Mhz and 2 mtr is 144 Mhz.. too broad of a jump. better off
running 2 separate amps. One would be very illegal since CB you are not
allowed to run Amplifiers at all.

Put a digiscan on it.

That, or you run an EPROM board with another PLL.

Either way, you are out some money, and a lot of time.

Better to sell it, and pick up an easier modified radio, unless it is =
EXTREMELY important to you.

Toll Free

Well, in order for your vehicle's computer to have a problem at Y2K, it would have to have some reason to look at the current date. Since you can disconnect your cars computer from power indefinately and then connect it back up, it will work just the same. If it needed a date, then there would have to be some sort of battery on board or some way of letting the user set the date upon power up. I don't think there is any such thing in ECM's.

Figuring worst case of 50% efficiency and a 13.8VDC supply you would need approximately 30 amps.

Worst case you would need approximately 400W (200 / .5) of power consumption so:

From Ohm's law
P = I * E or I = P / E

28.98A = 400W / 13.8VDC

Good luck.
John

>as that free band
>area, just who in the hell owns the airwaves anyway.....

specifically 27.410 to 27.990
26.510 to 26.955 less, ofcourse, the r/c channels, i agree 100%

Well, you said new but not resistive spark plugs and wires? You need the resistive type. Second, the coax isn't picking up the interfierence, it is the antenna! Your car is radiating to the antenna. I assume you are using a magnetic mount? Those don't have a real ground but use capacitive coupling for the ground plane.That can sometimes be the source of the problem also. Try running a ground wire of 10AWG wire from the base of the antenna to the chassis of the car, probably the roof rack. Keep the wire as short as possible and use soldered-on lugs. Make sure the ground circuit is as clean as possible. What I mean is as close to copper to copper as possible, you don't need a ground loop!

If this don't fix it, buy a new car :-)

Richard wrote:

> I have a question that has probably been asked many times, but I have to ask it again.... I just installed a Cobra 148 GTL ST in my 1994 GMC Safari van. I have an awful lot of engine noise, especially on SSB. I cleaned up all the ground points under the hood, but that didn't seem to help. It is not an alternator noise, or a fuel pump, it sounds like my ignition wires are bleeding. The ignition wires, cap, rotor and spark plugs are all new... I have also installed a 10 amp noise filter on the power wires.

who would want an amp for cb AND 2 meters?
might you be a ham? if not, watch out for leland, rfenforcer and the other hams.
they will jump down your throat.
if you are a ham, you're ok because they will find some excuse for you.
just so that you know, sometime in the past 2 years, i read, in either qst or cq magizine, a construction article for a broadband, dual FET, no-tune amp that would cover from below cb, past 2 meters.
i can't remember which mag. or which issue but if you could get into the archives, you probably find it.
good luck.

jeff

sorry for the double posting.
i'm not sure if i agree with you or not as you seem to attack both cb'ers and hams.
if this is the case, i have to respect you for being balanced anyway.
it is true that there is a lot of fighting here between cb'ers and hams here but if the hams would take their eliteist, holier than thou attitude and check it at the door when they get here and stop playing RF police about subjects that don't concern them, everybody would probably get along a lot better.
things concerning cb'ers on ham bands and bleedover to ham bands are VERY relevent to their hobby and should be addressed but out-band activities and power on cb and out-bands are NOT their concern. the problem is, that they take it upon themselves to condemn people for their activites.
if they came here with a more appealing demenor and try to guide instead of a lot of smart-ass put downs, they would have a lot wider audence.
the way they act, if they were asshole salesmen, i wouldn't buy one if i needed one.
have a good day.
jeff

This is the mod below according to RT-Mods book.

I've done several mods from this edition of RT-Mods without any mistakes...I trust it!

Good luck!

according to my cb pll data book, there no channel mods for this chip. it has a direct VCO so you can't even use a crystal kit.
you can't change the 10.240 crystal because it also controls the 10 khz channel spacing.
i've had sucess in either changing out the 10.240 xtal with a 10.245 or pulling the 10.240 with a capacitor to get even number channels between the cb channels ,ie; 26.960, 26.970 etc.without and unacceptable amount od drift for AM but thats about all.
good luck.

i can't speak for the quality or performance you'll get but radio shack, at
least used to, sell an ignition noise filter that you install between the ign.
wire and spark plug. you'll need as many as you have spark plugs. check with
chevy first to see if it will mess up anything in the vans computer  as it will
be a resistance in the circuit.
before computers in cars, it didn't matter but now, it might.
another thing that i would look at is the quality of the coax.
you can get cheap coax with a 75% braid or the "top-of-the-line" belden brand
with 92%.
the difference is how tight the outer shield braid is woven and how much wire
is in the braid and the price.
good luck.

You said you had new plug wires, but you didn't say if they were carbon
core or copper core. Even some new carbon core wires demonstrate high
resistance and could be noisey, so check them with your ohm meter. New
wires should have resistance approaching zero.

this is exactly the holier-than-thou BULLSHIT i'm refering to. if a ham comes to this ng, he USUALLY comes with both barrels loaded to blast someone for doing something on freqs that don't concern the ham.

if toll free is talking on ham freqs illegally, bitch him out. if not, butt out.

i still want to see your badge sheriff or see you leave town.

why don't you apply for commisioner of the fcc? then, and only then, will it be your personal business what OUT-BAND freqs or what power level toll free or anyone else, for that matter, uses.

if we get caught, you will get a free ticket to laugh your ass off but until you start paying our fines, again, butt out!!! if you and the other eliteists, brother-bubba-better-than you hams would change your attitudes and try to guide instead of comming on like a go-to-hell televangelists, you might get someone to listen to you. until then, all you sound like is a bunch of door-to-door salesmen selling stuff that nobody needs and bad attitudes with free demonstrations. after reading all the uppity crap, i would, and have, avoided a ham ticket like the plague so i wouldn't have to communicate / associate with people who act like this. the company is definitly better on the out-bands.

i like to go to the hamfest around my qth because of parts availability and prices and i get some of the best OUT-BAND equipment around and even if i don't mention that i am a cb'er or outbander, (OOOOOOH), to people that i don't buy from, i still encounter the same SHIT ATTITUDES.

aparently you all went to the same sales school and passed the test with flying colors.

the way you and other like-minded hams act here isn't exactly the way to sell anyone that your views are the "correct ones. if you were asshole salesmen, i wouldn't buy one from you guys if i needed one now.

there was a time that i considered getting a ticket and joining the local ARC but i couldn't stand the attitude of these and other hams that i've LISTENED to on dx ham bands. i and no one else is / am better than anyone else but those hams with this attitude problem either haven't learned it or have forgotten it.

have a good day.

jeff

I can't afford one, so I just fart into the mic instead. It works out just
fine, except for the steady diet of refried beans, eggs, sauerkraut, and
garlic.

I was diging around my attic and I found my dads old CB. I hooked it up and it workes decent but my question is, if I was to buy a new cb radio which one is the best for under $200.   And how far of range does it have.

I purchased a Cobra 148 gtl st and am very happy with the "functionality" of the unit. (It's a little big tho and if the size is not a problem, I would suggest the night hawk series.) I had a previous thread in this newsgroup asking the fine people which antenna I should get. You may want to read up on the responses. This is where your range will be affected. I purchased a Wilson 5000 mag mount through JCRE and have yet to really test the range due to the high levels of noise and skip during the day... but it gets out well I'm told.

Hope this helps.

I know someone selling a High output Ford alternator if anyone is interested e-mail me and I`ll give you the guys  e-address..I also have a picture of it...It was made to fit into a 1993 Probe GT so it must be fairly small...Rated to 180 amps but put out 194 amps when tested at Ohio Generator...Alternator is brand new still in the box...Sells for over $500 new I think he`s only asking about $225

I hope I did`nt brain my damage.

Brand New in unopened box. Will modify if requested for no charge.
Price includes shipping via UPS ground within continental US.
$375

These are excellent (if not the best!) units with one driving four. They are class AB and designed to work great on SSB. The output expected should be around 550W peak.

Email me to make arrangements...

After owning both a Pro-520XL and PC-76XL there is a world of difference. The PC-76 has the added advantage of the built in SWR meter to catch antenna problems before they start. PC-66 and PC-76 ar

ruggedly built with metal chasis and the 500 hundrd series is well
just a basic cb. If you want a better radio that will last a long
time get the 76 or 66.

Actually was built on it, Uniden owned the patent rights to the
circuit board, and cobra couldn't take it with them when the quit
having uniden build them. That is why uniden built cobras are in such
demand. And Cobra's are junk now.

I believe if you are looking for a nice Mark III SSB you now have a chance to
own it. It is all tested/aligned a ready for you. There's no reserve and it
starts at $200.00
It is worth your hard earned money and time.
Thank you for reading and atleast enjoy the pictures of my well taken care of
CB Relic. The serial# on Transmitter and Receiver match and it has the original
banana mic that has sold on Ebay for $70.00 and up alone.Check out the pictures
of this clean radio, both inside and out.

Remember the scene from Casablanca where Capt. Renault says to Rick:
"I am shocked, SHOCKED to discover that gambling is going on here!"
Then the casino manager reminds him to take his winnings with him.

I am shocked to find out that illegal radios and amplifiers are being
sold here on the newsgroup and at nearly every CB shop and truckstop in
the nation! Not to mention modified ham rigs.

theres dif methnds used to locate abusers.
One way is if the persons name and address are given, then the FCC can go right
to the door, but if I'm right must have a search warrent to enter. That is
after being sent a notice they have to reply to and give steps to avoid that
problem again.
One other way is Via rf hunt down, in that theres dif methods. Hams do foxhunts
(radio direction finding) or also another is triangulation. That method
involves at least 3 units in which area is marked off on a map, then using
Feild Strength measuring quipment they can pinpoint the location of the
operator.
This is just a couple ways, there may be more.
I hope this helps answer your ?.

Found this on alt.radio.pirate. Kinda scary when you think about it:

The following was monitored on 14313khz & 3950khz
and was a rebroadcast of information from the
WD4LUQ repeater system.   WD4LUQ, Bill Houston,
is a FCC employee assigned to the FCC's Powder
Springs, GA office.
Houston operates a ham radio station from his
FCC office during business hours.

The FCC tracked down a ham radio operator,
N2BYE, Kevin M. Kelly, who was allegedly interfering
with in flight aircraft.   (See FCC Press Release,
dated Nov 13, 1998.)

Houston said Kelly was caught when he made the
mistake of not imitating a drifting spur and started
transmitting on fixed channels.   Apparently, he
should have continued imitating a drifting spur to
evade FCC detection.

Kelly was using a cable TV modulator and an
amplifier as transmitting equipment.   His antennas
were hidden in his attic, and he had video surveillance

equipment to detect any approaching FCC vehicles, according to Houston.

Houston indicated that Kelly was mentally disturbed and was guilty of what was in the FCC press release. Houston further indicated he would provide additional details of the case on the telephone.

The WD4LUQ repeater system operates on these output freqs: 146.895mhz, 224.880mhz, and 444.700mhz.

I DID state that...

I was testing the export version of the Command Technologies HF2500DX... A three tube amplifier.

It would run up to 8 Kw on the lower end of the spectrum... Markedly less on 10 and 12 meters, although it would loaf along at full legal limit.

I have run a Texas Star Sweet Sixteen into one.

Make sure the SWR is low, and you will be fine.

I also replaced the RG-58 with mini-8.

Keep the carrier to about 400 watts on AM, too.

what is the band coverage?10-80 meters? what is the input drive?are the clean on
ssb?
what is the output and price?
thanks chris

    First things first a Radio Sack radio is not a RCI 2950, how ever if
i had to get one, the TRC-495 (The one with upper & lower side band w/
freq. counter) looked like a nice little radio till they discontinued
it. However I've noticed in the new Radio Sack 2000 catalog they now
have the HTX-10 which is a 10 meter rig, that does AM, FM, USB, LSB and
I believe CW. The two look identical. Are they? Also are they the same
```

```
radio that was offered in the Coppers catalog as the EAGLE (tomahawk?)
or something to that effect? Lastly (and most importantly) are there any
freq. mods for the TRC-495 or the HTX-10 or the EAGLE.

Thanks in advance,
        john (AARDVARK)

> are more like-minded like yourself and leave us alone.

I have thought about becoming an ham operator, because I am getting sick of 11 meter

```
because they bitch and argue to much. And all of the ham bands are used. The
communicate voice, computer, and morse code. I have no problem with them having
all
there bands.

> anyone can operate a ham radio therefore there should NOT be anything to bar us
> from being on ham freqs. if we go there, hams scream!!! what's the matter, can't
> stand the heat?

> an all band reciever, you'll find most of that ham spectrum isn't being used.
>
>                                    jeff

It is not that hard for someone the get a ham license, therefore I feel the earned
the privileges.

Sell your 225, put the money you get with the $200 you now have, and save up until you can get a Texas Star 500. The Texas Star 500 is a really good match to the 2950. It's also a big enough jump in output that you'll notice the difference. In other words, going from a 225 to a 350 is not very satisfying in that it really doesn't make that much difference. However, in my experience as a CB amp dealer, going from a 225 to a 500 will more often than not satify the customer to the point where he's not looking to upgrade again right away. Another thing you should know is that the 500 (four 2SC2879 transistors) is the biggest amp that can be efficiently run using the stock charging system in most vehicles. That's an important part of the decision for many people. That's the level that satisfies most of my customers. In other words, many people will stop at the level where they know they're running as big an amp as their electrical system can tolerate. It's a big step mentally and financially to decide that you're into CB enough to put together a second, devoted electrical system just so you can run a bigger CB amp. The vast majority won't go that far--they're satisfied knowing they're doing the best they can without taking that next big step.

> thanks for your Info.

```
     You're welcome.  I hope this helps.

Not necasarily (pardon typo), I had a Cobra20+ that had the leads accidently crossed and burnt the radio right up!! This one also had the 3rd wire for chanel memory and when I looked at the board, the wax or what was used to cover the finals was all melted down!! The radio was also tottaly dead so its was converted into spare parts after that.

I am trying to find out just exactly what features this radio has. A website I looked
at didn't say much about it. Can any 77-285AXL owner out there tell me what
features & controls it has? Thanks.

OK you HOLIER-THAN-THOU hams out there, i emphisize "holier-than-thou as this
DOES NOT apply to hams who DON'T act like the RF police.
i don't think we need to hear anymore on the subject of OUT-BAND or ILLEGAL
RADIO EQUIPMENT and cb'ers here.
we don't interfere with such important communications as aircraft and most
police and fire freqs are way out of our range.
there's a lot of dirt on both sides of the street so clean up your side with
all of the hams who do mars and cap mods without a permit and those who
INTERFERE WITH AIR COMMS before you point to the dust on our side with the
reletivly few problems that we cause with consumer electronics and YOUR ulcers
worrying about a band that even YOU can't legally talk on.
you've got all that spectrum going un-used and complain like the owners when we
venture into the de-milatarized zone.
grab a broom, a shovel and a mirror BEFORE you condemn us the next time.

yes, they do.
it's legal to buy and sell these radios "for export sales"  to countries where
these radios are legal.
that's why they call em' EXPORT RADIOS.

You've got it wrong. Hams don't want guys like
that in their ranks. You won't find any hams
defending this guy's right to do what he did.

If hams had a newsgroup that discussed methods
of interfering with aircraft comms and traded
tech tips and gear designed to facilitate that
activity, then you'd have more of a point.

>One way is if the persons name and address are given, then the FCC can go
>right
>to the door

i don't think the fcc could go "right to your door" just on a name and address,
even with a warrant.
first, they couldn't get a warrant just on a name and address.
if i knew you and we had an arguement,
does this mean that i could give your name and address out of spite to harass
you?
a name and address is useful so that the fcc can go out and intercept the
offending transmissions for use as evidence. then they might be able to get a
warrant if nessessary.
if they were to knock on my door sometime, they would need a warrant because i
believe they have the authority to inspect my station but they would have to
come through my house to do it.
without a warrant, either i will bring my equipment to the porch or they will
be looking at the outside of my door again.

The best would probably be the Uniden Grant XL or Cobra 148GTL.Top of the line in any reputable brand would be OK.Make sure what you buy has SSB for maximum range,other than that range will depend more on your antenna.

Stay away from the rigs that call themselves "10 meter" radios but are really just pretenders,these usually have idiotic stuff like transvestite boards and echo.

Also what I stated, illegal IF USED on 11 meters, Not illegal to own.
Thanks for reinforcing what I have already stated.

>
>This has nothing to do with a CB radio. Look at Part 95 from the days that

>the clauses of today.

>
>11 meters was also a ham band when that radio was made.

>
>So, your point is nothing.... My Kenwood TS-440SAT will do 11 meters. I
>bought it that way.

You seem to have trouble understanding that part 95 makes your TS-440 illegal to use on 11meters, but not to own. Part 95 does NOT make it illegal to own a trransmitter that is capable of exceeding the power limit or running outside the 40 channels. It does make it illegal to use it. So my point is more than nothing.

>
>Does that mean that it is illegal? No. Do I have a MARS / CAP license?
>No.

Why are you wasting your time restating what I already did?

>
>Do you honestly think that if the FCC came to inspect my station for
>(suspected) 11 meter bleedover, and all they found was my Heathkit SB-220
>and TS440 in line that I would be able to say "I never used it"? Even if I
>had a bone stock Cobra 29 on the shelf?

Do you have an amateur license? If you do You wouldn't be in trouble with the SB-220. If you don't have a license, its illegal to posess the SB-220. Thats clearly spelled out in part 95, also what I have posted several times. Get that mina bird to read posts for you, then you won't waste your time reposting what I have already stated.

>
>That is a bullshit argument that you are proposing.

>
>And you are wrong.

Since you have restated what I did, that makes your statements wrong also.

They were not banned. They were discontinued by most manufacturers for CB (residential) use because of the legal liability resulting from electrocution accidents. It was like giving some nitwits a lightning rod during a thunder storm. The manufacturers decided to drop these antennas because of liability reasons, not legalities. These manufacturers continued making them for commercial applications because they know most commercial guys know what they're doing.

> about metal antenna mast?

TV antennas aren't swaying in the breeze 18 feet over someone's head, add to that a 10' or 20' mast. I've seen guys, while installing an antenna, walking around their house holding onto a 10' mast with a 21' Super Penetrator on top knocking into all kinds of branches, wires and other stuff. It is extremely dangerous. I'm sure someone sued which resulted in a legal president, of which most all manufacturers took notice. Ill look it up in West's Law Review when I get the chance.

The following was taken from the FCC's web page at http://www.fcc.gov/wtb/prs/citzn.html

Please look below, and you will see where the FCC CLEARLY states that having a CB radio unit that is modified in any way voids it's acceptable use on the 11 meter CB band.

This should put an end to that debate.

May I raise the power output of my CB unit?

Absolutely not! That would be unfair to the other users sharing the channel by raising the level of radio noise. You must not attach a "linear," "linear amplifier" or any other type of power amplifier to your CB unit (CB Rule 11). Moreover, you must not modify your CB unit internally. Doing so cancels its type acceptance and you forfeit your authorization to use it (CB Rule 10).

It clearly states that modifying your CB radio voids its type acceptance, and makes it illegal to use.

Doesn't say (as some suggested) that if you just don't use it on 11 meters for transmit it is still legal, but it does state that if it is modified, it is illegal for use.

Plain english.

I have copied the entire page below... Plain english rules for those interested.

Toll Free

CITIZENS BAND RADIO

What is CB?

CB is one of the Citizens Band Radio Services. It is a two-way voice communication service for use in your personal and business activities. Expect a communication range of one to five miles.

Do I need an FCC license for my CB unit?

License documents are neither needed or issued. CB Rule 3 provides your authority to operate a CB unit in places where the FCC regulates radiocommunications, as long as you use only an unmodified FCC type-accepted CB unit (CB Rule 9). An FCC type-accepted unit has an identifying label placed on it by the manufacturer. There is no age or citizenship requirement.

Where may I operate my CB unit?

You may operate your CB unit within the territorial limits of the fifty United States, the District of Columbia, and the Caribbean and Pacific Insular areas ("U.S."). You may also operate your CB on or over any other area of the world, except within the territorial limits of areas where radio-communications are regulated by another agency of the U.S. or within the territorial limits of any foreign government. You may also be permitted to use your CB unit in Canada subject to the rules of the Canadian Department of Communications.

May I raise the power output of my CB unit?

Absolutely not! That would be unfair to the other users sharing the channel by raising the level of radio noise. You must not attach a "linear," "linear amplifier" or any other type of power amplifier to your CB unit (CB Rule 11). Moreover, you must not modify your CB unit internally. Doing so cancels its type acceptance and you forfeit your authorization to use it (CB Rule 10).

How high may I put my CB antenna?

There are no height restrictions for antennas mounted on vehicles or for hand-held units (CB Rule 8). For structures, the highest point of your antenna must not be more than 20 feet above the highest point of the building or tree on which it is mounted, or 60 feet above the ground. There are lower height limits if your antenna structure is located within two miles of an airport.

Which CB channels may I use?

You may use any of the 40 CB channels on a "take-turns" basis. These channels must be shared by all CB users. No CB channel is assigned to any specific individual or organization (CB Rule 7). Be cooperative. Keep your communications short. Never talk with another station for more than 5 minutes continuously. Then wait at least one minute before starting another communication (CB Rule 16). Use Channel 9 only for emergency communications or for traveler assistance.

What are "ten-codes"?

Ten-codes are operating aids used by public safety and other professional communicators. The FCC does not regulate the meaning of the ten-codes. CB Rule 12 authorizes CB operators to use ten-codes.

Where do I obtain my CB "handle?"

You may use on-the-air a pseudonym ("handle") of your choosing.

Are there other private Personal Radio Services for short distance two-way voice communications?

Yes. There is another Citizens Band Radio Service, the Family Radio Service ("FRS"). You are authorized by FRS Rule 1 to operate an FCC-certified FRS unit in accordance with the rules. No license is issued. Expect a communication range of less than one mile. See Part 95, Subpart B of the

Commission's Rules, 47 C.F.R. 95.191-95.194. There is also the General Mobile Radio Service ("GMRS"). For operation in the GMRS, however, your system needs a license. GMRS systems are used to facilitate the activities of the licensees and their family members. Expect a communication range of five to twenty-five miles. See Part 95, Subpart A of the Commission's Rules, 47 C.F.R. 95.1-95.181.

Where can I get a copy of the FCC Rules for CB?

The rules are published annually in the Code of Federal Regulations, Title 47, Telecommunication, Part 80 to End. They are written in plain language to make them easy to read and understand. Order from the U.S. Government Printing Office, Superintendent of Documents, Mail Stop SSOP, Washington, DC 20402-9328. A copy of the operating rules (95.401-95.428), current at the time of packing, must be furnished by the manufacturer with each CB set sold. For technical information, see 95.601-95.669.

For complete information, see the Commission's Rules for the Citizens Band (CB) Radio Service, 47 C.F.R. 95.401-95.428.

If you have any comments or questions about these services, you may call Bill Cross at 202/418-0680 or send E-Mail to bcross@fcc.gov

Ahaaaa .... What about all the hams that are selling frequency go everywhere stuff, and linear amplifiers here on the ng?

I do enjoy you Rhooligan2, you are a lot of fun to read. You remind me of a guy we call "Milktoast"
Whaaaaaaaaaaaaaa.....aaaa.a..a....a.a.aaaaa, in a high pitched nasel tone, he says: "We got rules, Mr. Jay you can't do that, what will the big boss'es say?" "I am telling"

Jay in the Mojave

Lost in Space WAS BETTER than "star trek." I think that the reason star trek was pumped is because: (a) NO CB's on the program, like Lost in Space had (hand held WT's!), and that their shows were Christian based (where the bad guys always lose), not like star trek's "humanistic" religion programs promoting the one world nonsence! Ask yourself: WHO was control in each program? A UN slave state "earth" or the USA ? Or was "control" really on "Get Smart" against KAOS ? Do we have KAOS on the CB band today? Where is the LIS Robot saying "WARNING-WARNING"---Texas star overheating BIG pills on your dilithium crystal tetrachloride crystal coatings! Did the Robinsons get back in '97 ? Did you know that John Robinson was a fameous figure in our history (Pilgrims)? Getting back to '99 now, in a future post I may

blast a left coast CB dist. for selling off freq. crystals. I am going to
see IF they will give me credit for ones 2 keelocycles high on xmit they
sold me before I tell you good CB shops out there to AVOID THEM because of
selling OFF FREQ CB SINthasized crystals to me. I should of just ordered
them from hurricane land instead.
Dave!!!

Bill:
That is NOT the question he asked. Your radio is good, BUT the 959 is NOT a
"real" Galaxy. I fixed 1 recently--it is really 1/2 a Galaxy!   I would say
don't buy the 959 because it is an "American" version of the real Truck
Drivers CB's !!!
Dave!!!!

Actually, if you get a 2 meter amp, it IS a CB amp! Because 2 meters IS the
Hambo's CB 2 meter band! I'm not on there, it's what I hear from the
Hambo's that I know. So your 2 meter amp IS a 2 meter CB amp!!!!
Dave!!!!

If your going to put an aend to the debate post the part 95 plain
english version which reads:

RULE 9 - Equipment

{A} You must use an FCC type accepted CB transmitter at your CB
station.You can identify an FCC
type accepted transmitter by the 'type acceptance' label placed on it
by the manufacturer. You may
examine a list of type-accepted equipment at any FCC Field Office or
at FCC Headquarters. Use of a
transmitter which is not FCC type-accepted voids your authority to
operate the station.

>>>>>> here it says use a transmitter, and that use of a transmitter which
>>>>>>is not FCC type accepted voids your authority to operate the station.
>>>>> What does use of a transmitter mean? It doesn't mean own or
>>>>> or poses it clearly states USE.

{B} You must not make, or have made, any internal modifications to a
type-accepted CB transmitter.
<*read Rule 25> Any internal modification to a type-accepted CB
transmitter cancels the
type-acceptance, and use of such a transmitter voids your authority to
operate the station.

>>>>>Here again it says USE of, it never says own or poses.
>>>>>You lose the authority to operate the station when you use the
>>>>>transmitter

Say UNI DEN ! Cobra is a cheapened up version (Same thing), made with less
quality in Malasia. Cobra IS JUNK in 99 !   Dave!!!!

AB7RS wrote in message <37E4FBF5.1985@imt.net>...

Galaxy radios are built to operate
on the 10 meter Amateur Band........

  They are NOT 11 Meter CB's!

This happened @ a "Sunday Morning" (false state "Church" service)?   You
hambos & 10 meter people out there can be assured that I tell EVERYONE with
a more than 40 Channel radio to STAY OFF 28 & up Megacycles !!!!   That's
where dem Hambobo "old ladies" reside!!!!   The YL's are on CB ! The old
ones are on 10 meters!!! I tell 'em "stay away" from dem old "ancient
mary's" & other modes above CHANNEL 99 in '99 on their 99 !!!!   Dave!!!!!!
!

Ooohhh.....

Your a bad man...

Afraid to use his own email address or post from his own server, I see...

Guess your wife would be real happy and proud of your spineless ass, wouldn't she...

Kids wear bags on their heads when you make them ride around in the brown Pinto with an orange door?

Yep... Guess you got me.

Guess Josephine will be parading my name and call sign around the world now.

Guess I am a marked man...

Guess.... Guess... Guess what.

I don't care.

This happens about once every four or five months.

I think it is funny that some asshole already tried to change my bio at QRZ,
though. That was cute!

Toll Free

since the mod is cut one wire and plug something in and its a full band radio
and the fact that the radios come out the box tuned for 11 meters rather than
10(if you can get one tuned from the factory) i would say they are pretty much
cbs. how many other ham radios do you see with echos and reverb?

BS.

The 949 and 959 are built in the same factory and distributed by the same
people who do the DX series radios.

They are a stripped down, legal 11 meter radio.

Once again, you are wrong.

Toll Free

Legally, yes. But just barely. Like their Uniden and Ranger counterparts before them, these radios were clearly designed for illegal use on 11 meters. How many "roger beeps" do you hear on 10-meters?

I was fumbling around in the dark with a 20 year old General Electric and got my positive and negative leads mixed up. Stupid move I've never made before and will never make again. Needless to say, I made a little smoke and killed my radio. Now, I was wondering if anyone can tell me if there is a simple fix, like a burned out unit or wire on the board, or if the radio is blown all the way through.

Nothing at all works. No lights or sound. I noticed a burned out segment of wire on the bottom of the circuit bored, the flat side with all the soder. I tried to soder it back together, but it started sparking once I hooked the power up. I took a meter and touched almost every bit of soder on the board. Each one yielded 12 volts with the exception of soder along the melted line. I could get 12 volts in the hot places no matter if the radio was switched on or off.

Obviously, I'm not the best at working with things like this. I'm really just wondering if I could fix it without too much trouble or if I should chuck it into the trash.   As I said, it's twenty years old, I found it in a discarded location and I've got three other radios as it is. So if I wind up tossing it, I haven't lossed much anyway.

Thanks for reading.

Most 10-meter radios I see for sale have roger beeps built in. So,
either the manufacturers of 10-meter radios make much more money on
selling to CBers, or there are a lot of hams who use roger beeps on 10
meters.

FCC Type Acceptance = Authorization to Operate

Any radio that is FCC Type Accepted for Part
95 operation will have a plate or sticker on the
back of the radio stating type acceptance!

For a base unit, you might consider a Uniden Washington. These radios have a very clear modulation. Base station radios have a built in power supply that allows them to be plugged directly into an electrical outlet and do not require a separate power supply like a mobile radio does. They also have more of the " look " of a home appliance that helps them fit into the overall asthetic of your home furnishings.

However, a mobile radio can be adapted for use as a base station by using the previously mentioned power supply, and has the added benifit of being designed for use in a vehicle, in effect giving you two radio's in one. A really good mobile radio is the Uniden Grant XL.

Take one of these radios, hook it up through some good coax, like RG 213 U, to a decent antenna for the money, like a Maco 5/8's wave ground plane, and you will be on your way. So Long

Here is the excerpt from Part 95:

Rule 9 - Equipment

{A} You must use an FCC type accepted CB transmitter at your CB station.
You
can identify an FCC type accepted
transmitter by the 'type acceptance' label placed on it by the
manufacturer.
You may examine a list of type-accepted equipment

at any FCC Field Office or at FCC Headquarters. Use of a transmitter
which
is not FCC type-accepted voids your authority to
operate the station.
{B} You must not make, or have made, any internal modifications to a
type-accepted CB transmitter. <*read Rule 25> Any
internal modification to a type-accepted CB transmitter cancels the
type-acceptance, and use of such a transmitter voids your
authority to operate the station.

Sorry Tim, they don't come out
of the box from the MANUFACTURER
working on 11 meters!
  The only way they operate on 11
meters "out of the box" is if your
local distributor or retail outlet
has previously performed the
modifications.
  These radios come into the country
as 10 meter radios! If they didn't,
we would never see any of them, much
less be able to buy them!

My point exactly. You NEVER hear roger beeps used on the 10-meter ham band (except by illegal bootleggers.) The inclusion of such a feature makes it pretty obvious these are intended to be used primarily by CBers, not licensed hams.

Recently, I have also seen "10 meter radios" factory-equipped with "robot voices" and other "noise toys." Not a real popular option among amateurs.

Correct. Most of the Galaxy radios are 10
meter rigs. However, the 949 and 959 are true 11 meter CB rigs with legal limit
output.

I am kinda new to CB ....
Question: There are obviously thousands of these 10-meter Galaxy rigs operating
on
11 meters. How does one get them modified for 11 meters????? Is this
something anyone with a screwdriver and
wire cutters can do by themselves, or are
we talking brain surgery here?

Maybe Roger Beeps?

{B} You may use your CB station to transmit a TONE SIGNAL only when the signal is used to make contact, or to continue communications (Examples: tone operated squelch, selective calling circuits). If the signal is an audible tone, it must last no longer than 15 seconds at one time. If the signal is a subaudible tone, it may be transmitted continuously only as long as you are talking.

The original purpose for the roger beep in the early NASA moonshots was to let both the astronauts and ground control know when the other party had completed their transmission as well as providing an indication that the mic was no longer open, indicating to the receiving party that that they had the "all clear" to begin the next transmission!

In the above sense, one could read the section in part 95 above and conclude the following!

The use of the roger beep could be considered to be "an invaluable aid to the continuation of communications" when perceived in the manner in which it has been used in times past, as in the case of NASA, etc. .

Ahh, but the beauty of the Uniden Washington is that it was also
designed to be used as a mobile.  It comes complete with DC power
cable and mounting brackets/hardware to install it in a mobile.
Albeit, you'd probably need a vehicle with a huge dashboard.  It would
probably work best in a camper or RV.  It is nice to know that you can
hook it up to a car battery in an emergency situation.

Your wrong Jack,they don't even cover the entire band,don't have all the legal modes commonly found in real HF rigs,no memories,no scan,no CTCSS,no split TX.They are EASILY made to operate on 11 m and are designhed to be that way,they also include LSB which is not used on 10M.

These are non type accepted CBs thinly disguised as 10 meter radios.

What do those people who do not own a computer do? Not everyone is on-line or cares to be on-line you know.

Why would a ham spend that kind of money for a low powered radio that only has 1 band? For $599 you can get an all mode HF with 10 bands including 10M plus 100 watts,memories,scan,etc.,etc.

And there are a lot of used rigs like my $325 TS-430S that make the Galaxies look like the cheap toys they are.

I am looking for a CB for basic comm for frequent road trips. Uniden's webpage has several reconditioned units at (what appear to be) pretty decent prices. How do the PRO-series units stack up against their bigger brothers like the 66 or 76?
Remeber that basic communications is all I'm looking for (monitoring upcoming weather/road/police conditions, communicating with others travelling in tandem with me, passing the time on the road, etc....) and the smaller footprint of the Pro-series seems attractive.
OTOH: does something like the PC66XL offer a significant difference in quality and features for the small price difference?

thanks,

Keyton

Er, could it be that you did NOT read the post?
the poster did NOT specify "CB" band freqs.
he said "11 METERS".
next time i guess people will have to use the code so you will understand it.
WHAT A CONCEPT!!!
if we all speak english, you won't have anything to say.
i'll have to remember that.

YES There is!! The plate & FCC ID # is on the back. The Galaxy DX-949 & 959 are the only "legal CB" "galaxy radios" They are FCC approved, are only 40ch 4W & DONT have built in echo, FM, external heatsink or channel band switches.

his assertion makes a lot of sense.
you and your ham buddies are always bitchin' about out-bander activities but
you always side step this issue and make excuses for someone with a ticket.
your assertions always try to give the impression that hams are gold and
out-banders are lead.
well there are some hams whose gold paint is chipping and you are the first one
to run for a paint brush and either cover it up or distance yourself from them.
why don't you jump on them like you do us when they come up?
professional courtesy mr. RF sheriff???

don't forget to provide for proper cooling.
depending on how large the amp is,1 kw, 2 kw, you could concieveably use a
generic electric radiator cooling fan obtained at an auto parts store.
good luck.

one thing you might try, your spare tire mount is on a hinge.
this does not provide the best of grounds.
ideally, you would go out and get some broad wire braid, (3/4 to 1 inch wide),
and install one solder lug connector at each end keeping it as short as
possible.

connect one end to a CLEAN, (no paint), bolt that holds the spare tire mount on
and the other end to the antenna mount ground.
if this is not practical, clean the paint off the spare mount at the antenna
mount and connect the other end of the braid to the spare mount.
if you can't get broad braid, you could use the braided shield from a piece of
RG-8/U coax. NOT RG-8/ mini. it's not very broad.
good luck.

>i don't think we need to hear anymore on the subject of OUT-BAND or ILLEGAL RADIO EQUIPMENT and cb'ers here. we don't interfere with such important communications as aircraft and most police and fire freqs are way out of our range.<

I don't 'spose it would do any good to point out that (a) he was reported as "menatally disturbed", and (b) that he didn't use a "radio transmitter", per se to cause the interference. He used the harmonics from a TV cable box to create the stir.

This is not a "run-of-the-mill" ham.

And as far as enforcement issues go, you will please notice that the Congress is attempting to pass legislation to allow "local" enforcement of radio regulations due to illegal operation on 11 meters...not on 2meters, 20 meters, etc. As a matter of fact, licensed Amateurs are to be specifically exempted from any prosecution.

Personally, I hope that legislation falls flat on it's face, Ham or not...simply because the "average" cop is NOT going to know how to properly identify one radio from the next, and this can only spell trouble for ALL operators. But the fact is that an overwhelming number of the complaints besieging the FCC are the result of illegal 11 meter ops...NOT illegal Part 97 ops.

You are right that everyone has their share of kooks and ner'-do-well's. So take a valium.

Steve

>
>

i agree with you on 99% of what you say.
you seem to be an even handed person unlike other hams that i've argued with here lately.
as far as the ticket, i disagree.
the code is a barrier that shouldn't be required but should be optional.
i know that it's there by international treaty but that part of it should be abandoned.
i've read here and have heard from many hams who say that once they've passed the test, they never use it again and don't remember most of it.
if i were to get a ticket, my only interest would be voice, packet or other technical modes of comms on hf, NOT code. i personally have no interest in vhf or uhf
the only use for code on this news group seems to be to beat cb'ers and out-banders over the head with it.
i've talked around the world on ssb at 200 watts or less on the out-bands with no problems at all.
just like the horse and buggy, there WAS a serious need for the code once upon a time but in light of technical advancements in the last 90 years, it's time to put it out to pasture and use it for recreation instead of one of the required modes of transportation for our thoughts and ideas.
even the U.S. navy and coast guard don't monitor it anymore which, from what i understand, was the orignal reason for the requirement of it in the first place.
dependable communications for ships at sea. i've not seen any tech manuals written in code which is what my main interests in radio is. the technical end of it which is what the amateur hobby needs to survive. many commerical inovations have come out of amateur radio but the younger generation takes one

look at the requirements for a ticket and turn their backs because of the antiquated code.
this younger generation is one of the most technically advanced in history.
my daughter in 3rd grade and has been using a computer for 3 years now.
i marvel at the thought of what she'll know when she graduates college. now multiply that by millions of kids with this knowledge getting into the amateur hobby. the possibilities are endless IF the code doesn't stand in their way and clutter their minds like so many cookies in a hard drive.
if the armed forces don't monitor it, maybe there are other dependable modes that they trust as much or more than the code. maybe we and the rest of the ITU should come into the 21st century and pull our collective heads out of the sand and see the other side of the microphone. it really does work better than it did in the 1920's.
have a good day.

jeff

I know a guy that has a Cobra 29 LTD Classic Gold that stomps any of the new cobra classics from factory... it was tuned by someone (NOT modified) and it seems to get out a lot better and receive is quiet good... is there any difference in the GOLD and the standard classic??.. I installed a XLR jack for the guy (he broke his out) and I took a good look inside... nothing had been cut and the limiter didn't look as if it had been adjusted. Thanks for any info,

J.T.

Yep Jack, just updated my license via mail... good until 2007, got it
in the mail the other day... actually it didn't take but 2 weeks for
turn-around... figured it would be a lot longer. I mailed in the
information and the printed out form for renewal. I have been on the
ULS online when they first started it... sorta lame, or was.

>> >
>> > FCC has no more paper forms.

<<you always side step this issue and make excuses for someone with a ticket.
your assertions always try to give the impression that hams are gold and
out-banders are lead.>>

Jeff -- since you seem to be terribly confused,
let me outline my longstanding opinions for you:

*Outlaw hams are just as bad as outlaw CBers. Maybe worse.
*A ham ticket doesn't make someone an authority.
*There are good and bad people in both ham and CB.
*Illegal power sucks. A "big radio" does not make you a man.
*The "Freeband" is not free. If you don't like the law, change it.

It's your right to disagree. But if you are going to disagree,
at least have the facts.

Well, if you mean Spread Spectrum you might as well save your breath. It's almost impossible to do unless you have big bucks behind you to finance the gear.

On the otherhand, I have found that I can "descramble" the encrypted 46/49MHz phones by using an all-mode receiver, switching in the lower sideband mode, then slowly tuning through the carrier.

It's certainly not high fidelity, but you'll be able to understand the conversation.

You mean the TRC-485. There were no freq mods for that radio. This new
10 meter radio looks identical on the outside. Jon.

IF the legislation passes the cop that bangs on your door will prbably have
some special training( It wouldn't take much). BTW one thing the FCC really
responds to in a hurry is an interference report from the FAA..

I think this was intended to be used mostly by the VEC. Theorectically in the future you will be able to take the test and get your call sign on tne spot.

If that's where you have it mounted, then it's probably not grounded at all. So by all means....ground it. What is puzzling though is that you claim not to be receiving anything at all. You should be receiving something, even with a bad ground. Check the continuity of the feedline from the connector (part that connects to the radio) all the way

through the mount (where the radiator screws into the mount). Sounds
like you might have a break in continuity somewhere.

Hope this helps,
LJ

These radios come from the factory only working on CB and only do legal
limit. Almost any radio can be modified to work out of band. These were
made to hold to FCC standards.

I concur....Most shops charge something like $30.00 plus parts to repair
a radio. So you can rapidly get to the point where you could just buy
another one (used) for what it would cost you to repair the broken one
if the damage is extensive. Before you throw it away though, I would
check the polarity protection diode. You may have lucked out and the
damage is restricted to it alone. It's an easy and cheap repair.

It may be true for Ham licensing, but it certainly is not true for
commercial/business licensing. I sent in paper forms last week for
a system I support. The notice stated that I could mail the forms,
Fax them or use the ULS. I could also pay by credit card if I wished.

I got some requests to come back on here from others so I am back on here, I am going to get back in the game & fight! As for the HTML stuff I like it! But if you all can't take it then OK, I will not do it anymore! I want to tell you all that this NEGATIVE GROUP (some) needs to go back to read the rules. the part that says NO PROFANITY! Now someone E-MAILED me to tell me to be myself & there are people on here who do not want me to use 10 codes. Got a question? CB RADIO had 10 codes & the FCC requests us to use them! So I will use them all the time along with my call letters. Also if you people on here who are ham operators want to use this then I am sorry for saying anything. Also the KCBRN club web site is coming along fine! I am adding to it & have a CB CHAT room (text & voice!)! I have not made a CB ROOM yet, But will do so soon. I am not going to bother telling you all how to act because this is wrong & if I did then I AM SORRY, see my father has German blood & Germans stick to rules 100% & I got to tell you that my father (YELLOW BIRD in the 60's & 70's) once told me that I do too much of the rules. He told me that some people do not want to bother with the FCC rules. So I am sorry, but if you do not like my 10 CODES or call letters then IGNORE IT! Just like I am trying to IGNORE the bad side of CB RADIO. So I will be on here 10-10 (on the side) & will not give in to all of your negative stupid suff. If you do not like it then this is your business as well if I do not like your alls cussing & negative comments then it is your business! I am trying as well as others to enjoy my hobby & I & others are *NOT* going to see a few people mess it up for others! Thank You!

I was told that anyone on here who wants to get in to good CLEAN, CUSSING FREE CB RADIO messages with NO MODIFICATIONS + good 10 codes as well as some good clubs then come up to the legal side of CB RADIO! Come up to http://www.onelist.com & do a search for cb radio & go 10-8 like I & others have. As 1 person said 'rec.radio.cb is the worst news group for illgeal CB he has seen.' We are a GOOD CLEAN GROUP! So set your computer to http://www.onelist.com & join us! Or you can be on here with the DIRTY SIDE. (Now I know what they mean about 'dirty side down') I am out of here!

     The vertical tranformer 4 pills (Boomer Deluxe, Palomar
     Elite, Palomar Deluxe, etc.) are very unstable when run
     with a tuned-up 2950.  The instability shows up as a
     high output SWR, squealing, "fuzzy" audio, amp won't
     unkey, amp runs hot, etc.  Unless you like to experiment
     with patch-cord lengths, antenna coax lengths, special
     mounting positions, and other voodoo instability remedies,
     I don't recommend running them with tuned-up 10 meter or
     export radios.  Stick to a brand that's known for having
     reasonable stability like Texas Star, Messenger, Blue Face,
     or one the better customs like Dave Made or X-Force.

Supposing I have unlimited funds what would be the best mobile antenna to buy for 10/11 meters? I already have a Wilson 500 and for some reason it doesn't work right on my car. It talks good, but doesn't want to listen. Now if the best antenna for me is a tall antenna what about a short antenna? People have suggested a Super Penetrator, Wilson 5000, Firesticks, and even a $50 Radio Shack penetrator look alike. What should I buy? I doubt there is a best antenna to buy, but I need suggestions for my car. If it helps I'm doing all of this from a small sports car.

CBKING is starting a new club & we (the members of WHEATON VILLAGE) have been told of this group. We here @ WHEATON VILLAGE are a private group & we support CB KING 1000% in his NEW KCBRN club! This club will be 100% better then the KCBN club & even better then CB RADIO because it will have CHAT both in text & voice. It will have 40 Channels & more. CB KING I can tell you is a great person, he has helped our village grow! (THANKS CB KING) We also want to tell you that we have been listen to some of the HASH & TRASH on CB RADIO like 19 & do not like it. Now if you all knew CBKING you will find out he is a nice person on & off the air. So do not be nasty to him & there is someone on here called toll free (strange handle) that from what CBKING has told us, is a real pain, which it is his bussiness so we will leave it alone! So this is COMPUTER KING #1 = KCMN = 20902 10-7 @ 03:06

That is a turnaround. Generally, just about any antenna will work fine on
receive - if it is resonant. This is the first time I have heard of an
antenna that transmits well but has poor receive. Have you tried any other
antennas - to see if the receive is better?

I used to sell the Boomer Deluxe 400s and 600s. They're low-buck
amps that I found to be terribly unstable in many applications--
especially those involving tuned-up export or 10 meter radios.
Personally, if I were you, I'd stear clear of those units. There
are two glaring design flaws in those amps: First, they claim to
be biased into the AB class; yet, by design, the bias is grounded

out. That will cause audible distortion on SSB. Second, they use extremely high-gain transistors, yet there's no direct negative feedback to increase stability. The negative feedback that is supplied is derived in a cheap, ineffective, roundabout way. That's why those amps are unstable. The very obvious design goal as far as those amps are concerned is lowest possible parts count--which ultimately results to minimized production costs. In simple terms, the manufacturer is cutting corners in order to put out units that can be sold at prices that cut the throats of the other, more conscientious manufacturers. Do you want to support a manufacturer that plays like that? All amps aren't created equal. A 4-pill for under $200 is very appealing, but you have to see past the price.

You're on the right track wanting a 4-pill. The best production 4-pill by far is the Texas Star 500. The problem is that they aren't cheap. My customers remind me of that all the time. I tell them that sometimes you just have to suck it up and pay for it because it's worth it. There are other, cheaper 4-pills available, but none of them are in the same league as the Texas Star 500 when it comes to gain, efficiency, and output.

I sell Pirate 4-pills that are called 500HDs. Mine are fully featured and biased to Class B so that they sound right on sideband. They're nice amps, and the price is decent, but they won't keep up with a Texas Star 500 when it comes to power. The ones I sell use SD1446 transistors. I've also had them built using 2SC2879s which drive the price WAY up. Even with the 2879s, the gain, efficiency, and output are not at all on par with the Texas Star 500.

In my opinion, there's only one choice in production 4-pills when you want maximum performance: the Texas Star 500.

I'm a ham, and I do nothing but give constructive input (unless I'm in a mood where I want to raise Hell). I give advice on frequency mods and RF power amps too. Not all hams are anti-CB jerks. I don't know why there are so many threads out here about that. In my opinion, it's a two-way street.

    I tried another Wilson from a friend, but I couldn't get a good enough
match on it.  Other than that I didn't have it on the car long enough to try
it out.  I just want to be able to hear everyone that hears me.  I can buy
and try, but there aren't many shops close to me, I have to mail order or
drive to get stuff.

Hello Group,

Where can I obtain a new knob set for the Galaxy 2527? Galaxy does not sell direct apparently.

Thanks,

Rick Unit 550 VA

>IF the legislation passes the cop that bangs on your door will prbably have some special training(It wouldn't take much). BTW one thing the FCC really responds to in a hurry is an interference report from the FAA.<

I agree about the FAA getting ASAPservice from the FCC, and it should. Nothing more embarrasssing than a 747 full of people plowing into a mountain top because of a navigational error induced by a faulty NAVAID signal.

But as far as the "special training", there's no way that they can invest enough training in eveery cop to recognize every possible variant of a radio that might be used.

I personally own two 11 meter rigs converted to 10 meters (and ONLY 10 meters), but I also own an 11 meter SSB rig (stock). There's no way that John Q. Law is going to be thouroughly versed on what's a legit modification and what's a bogus switch.

Between burying my Dad and one of my kids this year, I have had enough bad luck without having to spend money on a lawyer to get my legally modified radios back from some over-zealous Radio Rambo.

If you read the ham NG and/or QST, you will find that the fellow in question
was condemned across the board by the Amateur community.

Hams have plenty to say about those who break the regulations, and hams often
are the ones who help solve the case.

>RF police hams are always
>pointing at our pile while ignoring the heap behind them.

You are flat wrong on this one. Find another topic.

>the Palomar 225's

No it is on a switch.

> How about the preamp ? Can it be used without the amp
>turned on ?

Yes it has a pretty good pre amp and it can be used with out the amp being on.
I saw a couple of replys to this that recommended you drive the amp with a
modulator. You can do this with the 500 R,but Not with the 500 V (variable).
You will find that you burn out the variable pots and the amp wont work right.

It is an oxymoron. There are no 'out bands', just bands assigned and rarely used. By using these assigned bands, you may or may not interfere with other services, but for certain, you have the potential for interference, and THAT is the point. Interference to another service with a clean radio is still interference.

You must be a moron. If you don't like the thread, just go on to something else. New people come here all the time and ask inane questions only a person very new to radio or electronics in general would ask. From this it is easy to deduce that they have no idea what Part 95 is, let alone have read it. So, put a cork in it and go on. The intent of most informational posts is to be====informational. Beyond that, you likely should drop your spare quarters in the coffee can to

save up for the attorney's fees you will eventually pay for your
dumb-ass actions.

midland radios are real fine rigs but most leave something to be desired in
the filtering department....they are known for noisy recievers....

well I'm not interested in VHF....   thats what makes HAM radio so good....there is something for everyone...

its funny but I hardly ever work VHF and yet I have 2 repeaters operating
one at 147.0 and one at 146.61 the 147 is the hottest repeater in the
state.   setting at 2050 feet...average terrain is about 900 ft.
but I'm an HF freak....You can find me on HF anyday.....14.193
give me a shout if the band is open

>This is'nt an accidental encroachment into the CW portion of the band,
>this is in the phone portion of the band, well into 10m!!

In my opinion, this is even worse than "accidental" encroachment. These clowns knew full well where they were. They were purposely bootlegging in the phone portion of the band!

I have encountered and confronted this type of operator. Their attitude is typically much different than those found around 28.000-28.100. Whereas the "encroacher" will usually aploogize, say "I didn't know", and move back below 28Mhz when asked politely, the deliberate bootleggers in the phone band will respond with "so what?" or worse. They will basically dare you to "do something about it." Then, they either ignore you or turn up their linears and continue their conversations. There is absolutely no justification for this kind of behavior.

Hello,
I have been selling on Ebay and the prices on some things just cost to
much to sell there, So I have another auction site I have moved some of
my stuff to, Its called Up State Auctions and there new and trying to
get started. I have spoke to the owner several time and he is a nice guy
to deal with. I am looking for a place to do some swap, sell, dealing
and trading other than ebay. If you get the opportunity stop by at the
link I have place below and have a look at my stuff and look around, and
list some of your stuff... I do have a bunch of new radio's and
accessories I am selling at well below retail value. I am not a dealer I
do this for a hobby, for the last 30 years..I will also place a link to
me on ebay and you can check my feed back rating..I am letting the items
listed on ebay run out and them my realist a few..
Thanks for your time.
Alan.

I have a Jeep Cherokee and a Cobra 18 WX ST CB.

What's the best antenna I can get? How much $$?
I'm thinking of mounting the CB antenna across from the AM/FM Radio antenna
on the hood.
So it would be on the driver's side.
How long of a cable should I run? Would running a shorter coaxial cable
reduce the loss of power?

I would go with a Wilson 1000 magnet mount on the roof of the Jeep. That way you don't have to unscrew a whip type antenna all of the time. This antenna comes with its own coax and it sells at www.copper.com for about $60.

CONFESSION: I really was trying too hard to make CB RADIO the way it was & I saw some web pages + onelist.com & this news group as well as other SSB stuff. I also saw pictures of radios as well as REACT web sites & thought to my self that CB RADIO is like HAM with people talking about different things & I also thought that using codes was in too. But I do not know how CB RADIO (AM/SSB) is today everywhere. But where I live the air waves are full of bad manners & anything goes. No FCC rules or respect & no 10 CODES or breaks or any of the good CBers of the past. I am ashamed on how people do not care & how people are letting anything go. Something to think about: What if YOU are on the radio & had to get on for an emergency & had no cell/car phone & no one heard you. Would you want be left for dead or would you want help? Think about people you love like your family? They care about you even if you don't! THINK ABOUT IT!

Geez, I wish there were more users on 10m in my area. All I hear is the CW beacon at 28.200.
No freebanders nor hams where I'm at. More activity on 20/40/80 though.

Hello,
I am new to CB'ing, but after lurking here for a couple a months, Ive decided to purchase one. Ive narrowed my two choices down to the cobra 148gtl or uniden grant.
Which one is better? what are the pros and cons of each? I'm relatively inexperienced here so any input would be helpful.
TIA

Robert, I think you need to understand that the serious radio people, who were observant of rules and proper decorum, either migrated to amateur or dropped out entirely many years ago. The vast majority of folks using CB today are over the road drivers and other blue collars who spend a great deal of time on the road. Just listen. Remember--there is absolutely no training required to operate a CB. I'm not saying this is wrong, just a fact. As a result, everyone is on their own to develop their style of operation, and their mentors are those they hear on the air. The net result is:
1. people are untrained and share few common protocols
2. people are anonymous and this anonymity permits them to behave in ways that would shame their mothers
3. few are actually aware of the rules under which they operate
4. there is a high level of disdain for rules and regulations

5. without any visible regulation, the quality tends to spiral downward

I think all the serious 11 meter ops are on the freeband because of
the deplorable state of the "legal 40". Also, wasn't the guy who
caused the interference using something other than a CB radio?

If you can hear engine noise in your cd player, try cleaning the
connections on the plug wires or checking their resistance and replace
them if the resistance is noticably high. Use resistor spark plugs.

(BEFORE PROCEEDING READ THE MATERIAL FULLY THROUGH TO MAYBE PINPOINT OR FIND A COUPLE OF AREAS THAT MIGHT HELP CLEAR YOUR RECEIVE)

Oh S*&T don't use that word pro!@#$%^&*ls. It will go to there head.

Take the antenna off and turn the volume up on the radio loud and listen to hear for the same noise if the noise is still there it's coming in via the antenna. And if thats the case, you probably bought the 25 or 30 dollar magmount and thoughs things no matter how flat of a match you get they just pull in all sorts of static noise. I had one for a while when I got a new vehicle. Cause I wasn't gonna hard mount it, and that antenna was picking up static noise off of my tires going down the road. If thats the case get a new antenna. I prefer my Fire Stick II matches up well with radio and has a very quiet receive. I need that cause friends and I have Rabbit hunts every weekend and we hunt in a hilly terrain and you need to hear those faint signals. Any ways enough with that stuff about my self.

First things first we'll try with the easy fixes and get more in depth.

Does your alternator have a capcitor used for filtering the (I do beleive for the field) if so make sure it's tight and got a good ground. Or get your alternator tested to see if a rectifier has gone bad.

Getting the power to the radio:
Second Is your radio getting it's power from the fuse panel in your car? If so remove it. Run the power wire directly from your battery (Positve lead). If for a purpose I'll explain later you can use Coax as a power wire use the inner conductor for power, and take both ends of the shield and mount it to the cars chassis frame. do not use the shield for a power ground. Use a seperate ground wire off the the radio (expalined below). Route all power wires as far away from the ignition wires as possible in the engine compartment. And away from any electrical motors, They are the worst offenderds of noise. I've driven down the highway on a rainy day and have had cars pass me and I could hear there windshield wiper motors in my receive. (so I tail gated them took down their liceince plate number and reported them to the FCC for Bleed over! Just Kidding.)

Finding a good ground:
The negative lead needs to be as short as possible, preferrably 18" or shorter. Find a big piece of metal to mount the ground to, and make sure the metal is not isolated from your bus chassis ground. To check this use a Digital Multi. meter or volt/ohm meter and stick one lead to a peice of metal on the car. If you have long enough leads touch the Negative battery post and touch the piece of metal you want to hook your ground to. If it reads .1 ohms or lower you should have a damn fine ground.

Ground wire connection:
Now before you crimp on a ring connector and get a sheet metal self tapping screw (I prefer a Nyloc Nut and bolt). Take some time first to use a wire brush or sand paper to remove the paint or primer off. Make sure you have a clean metal to metal contact. Thats the mistake a lot of DIY installers of 12V electrics make. Now mount the connector (ring, spade, etc.) down with the fastener. Now if you want to prevent rust or corrosion, you can get some paint and spray it over the connecton.

Now that you have a good clean install that should eleminate a majority of noise induced by the cars electrical system. If there is still alot of noise well look into the vehicles ignition system. if you have old decrepid ignition wires you might think about getting new ones. This could be the culprit. Get resistor plugs and wires this helps suppress ignition noise.

Now if that doesn't clean up the problem take it to a cb shop and see if your noise blankiting circuit is outta whack or something. Or go ahead and try a noise filter.

If any one has any other ideas or technique that helps to eliminate receive noise post it or flame me for what I wrote feel free. "Cause I don't ware my feelings on my shirt sleeve, so my feelings wont be hurt"

The only place flat enough to hold my magnetic mount on my 99 Taurus is on the very top. I'm not very tall and I don't like long external cable runs so I'd like suggestions on what other mounts will work. What are other Taurus owners using?

A permanent mount is okay but I'd prefer not to drill any holes. I don't need the antenna to be the longest-range and optimally located for best transmission since the radio is only used for playing with truckers that are fairly close to me :-)

As far as I can tell the trunk lid is plastic.

Thanks,
Amy

I would have felt there was hope for you if you had said you don't operate
above 27.405MHz or below 26.965MHz and the few non-CB channels in between.

Why not just look it up yourself?

Take the information from the sticker that's on their website at <http://www.galaxyradios.com/cb/949.html>, and do a search on the FCC site at <http://www.fcc.gov/searchtools.html> using the FCC ID# Search.

Might be a good idea to check the equipment you've got around the house while you're at it, just to be on the safe side.

Frank

Howdy, I'm new here. I have a problem. I got stuck in a traffic jam on the interstate in the middle of a group of semis. I think one of the guys(or it could have been anyone I guess) was using a modified radio or something, he was just drowning out everyone. Anyway, after he keyed up and before I could drop my squelch, I just stopped receiving. At first I thought the whole radio was fried, but I still transmit (I checked via phone, my friend could hear me-loud and clear same as always-, but I can't hear him), Has this ever happened to anyone? And is there a way to fix it? Thanks in advance for any help. Dan

Does anyone know if a Sommerkamp TS-800DX is marketed under any other names?
Most sets sold on mainland Europe go under several different names. If I
knew the alternatives, it would make finding information easier.

If it talks good it can't be a antenna problem, try it on a other radio or
try a other antenna, if you have a antenna problem it will (in most cases)
recieve good but talk poor.

i have five sams photofact manuals for sale. they are in very good condition & i am asking $40 or best offer. here are the series & the model numbers as follows:

cb - 180. pub april 1978. covers these models.
courier renegade 40
midland 79-892
realistic trc-461 /(21-1525)
royce 1-680

CB 121 published may 1977
COBRA 21XLR
COMMANDO 2340
PEIRCE-SIMPSON alley cat 23
PRESIDENT Dwite D
TRUTONE CYJ4732A-77 (23-4732-6C)

CB 104 published december 1976
MIDLAND 13-852
PACE Sidetalk 1000M (late prod.)
ROMAR ACT-1914 (code15206)
RYSTL cbr-1800
SHARP cb-500ub

CB 77 published december 1975
COBRA 85
PEIRCE-SIMPSON Bobcat 23C
ROBYN SX101
ROYCE 1-602A, 1-640

CB 49 published October 1973
B & K Cobra 20

COURIER Gladiator
KRIS 99'er (echo 99)
lafayette HB-525F (99-32492W)
Pierce Simpson lynx 23
SBE sbe-5cb (cascade li)
Tram Titan iv

serious inquieries only please.
you can reach me at my home phone (304)-428-2891. after 6:30 pm e.s.t .
please leave msg.
thanx

>I think all the serious 11 meter ops are on the freeband because of the deplorable state of the "legal 40". Also, wasn't the guy who caused the interference using something other than a CB radio?<

Who cares WHAT he's using for an exciter? Illegal is illegal, wether it's some jerkwad with a linear on the legal 40 with an otherwise legal radio playing music and jamming the legit users, or if it's one of those creeps in the megawatt mobiles?

It all boils down to this: By doing so they create QRM and frustration for thousands upon thousands of people who want to use CB but have their own rights trashed by a selfish and arrogant few.

I have a amped-up radio in my car. (I know I know....I don't play it that loud.)   I have been getting really bad interference when I am around my home. Anytime I am about 2 blocks from my home I get what sounds like garbled talking BOOMing through my stereo. Sometimes there is no one talking just a loud silence that sounds like it will bust my speakers.(hard to explain)   I get a little on my home stereo but I can't be sure its the same thing.

First: Can I filter something to stop this from coming through? (I would have to have someone do it for me)

Second: Is there a law that should stop this from happening?

There are no Antennas around my neighborhood that I can see. Is this a CB or a HAM?
Third: If it is a HAM is there a HAM organization that could help me out about this?

They are the same radio,Uniden builds the 148GTL for Cobra(Dynascan).The Uniden is usually cheaper because of this so why pay more?

There has never been a CB made that can't be modified,or a 10 meter rig.I have modified the suposedly unmodifiable CBs to operate on 10,6,and 2 meters.

This other station could have been close enough to you (a few feet) that your reciever was severely overloaded,check any transistors in the reciever or in line close to the antenna and any protection devices between them and the antenna.

I recently sold a 88 I used daily in a Mack dump truck (don't get more abuse than that) it never gave me aa problem and my buddy who now owns it is in love with it.

I now have a 99 I have been using in a Mack for a little more than a year that was in my pick up and it never misses a beat.

A CB modified for 2 meters? That would be a trick.

We've been over this already.

The 600HD is a vertical transformer amp like the Boomer Deluxe 400. Those amps are unstable--especially when run with 10 meter/export radios that use high-gain RF output transistors like the 2SC2312 or the MRF477. The 600 is a worse mistake than the 400. It has a driver stage which means it's prone to overdrive, yet it hardly makes any more power than the 400. It's even more unstable than the 400. The last one of those that I sold went to a guy with a 2950. We never got it to work right. It wouldn't unkey and his TX audio was fuzzy and contained an audible squeal. I added feedback to the amp and the radio, and filtering to the mic. That didn't change it at all. The guy wanted a clean installation, so he didn't want to play with mounting locations or antenna/patch cord lengths. In the end, the guy switched to a 148 just so the amp would work.

The cheap price is the ONLY thing that's good about those amps.

If you want to save some money, still be in the 4-pill class, and own a stable, top-quality amp, get a Blue Face (will say "Magnum by Palomar" on the front face) 450. It won't keep up with the Texas Star power-wise, but it's overall design, stability and build quality are better, in my opinion.

OK, lets make sure we get that slim sharp razor out and split these hairs evenly........The HTX-10 won't be "easily modifyable" in the "normal" sense that somone can move a jumper/ add a resistor & the radio displays & operates on the CB band, but a "qualified" somone probably can change a lot of coils, caps& xtal ect & get the radio to operate on 27Mhz or other nearby freqt, but the radio does not have a real freq counter, so it will still only display 10M freqs since the microprocessor & display driver chips are hardwired by their "internal design" for 10M only.   Most people asking if the HTX-10 can be modified really mean "like other export & 10M rigs", the ones that are actually built & designed w/ chips & display drivers that allow full 26-30 use,which are then actually "blocked" or "modified" by the factory for 10M only operation so that they can be legally imported, & then are "restored" back to the original full freq design by a simple "mod".

The HTX-10's "brain" is not a blocked full 10/11M design, unlike similar looking radios from "export" mfgrs & dealers.

>
> It all boils down to this: By doing so they create QRM and frustration for thousands upon thousands of people who want to use CB but have their own rights trashed by a selfish and arrogant few.
>

Unfortunately, it's more than just a "few". The selfish and arrogant seem to be in the majority these days. These people have no apologies or regrets for their actions, and will defend them to the death to those of us that point out the error in their ways. "Yea, I'm illegal! So what! Do something about it or be quiet".

Used to be a time when you "bent" the rules a bit to make the hobby a little more interesting, and less confining. But once you start that trip, the amount of bending just gets greater and greater. To the point that you don't follow any rules. The suggestion that there ARE still rules, brings on such a retort, that you'd think that you just suggested that we all sit in church every day, and never watch a dirty movie ever again.

There used to be a middle ground. The original CB service rules, never intended for the band to be used as a hobby band. A few rules bent and once that changed, CB was a neat and relatively cheap radio hobby, that didn't require the dedication and know-how that the ham radio service required, with the added bonus of a more interesting and diverse group of people to talk with. People were technically running illegally, but they still conducted themselves with some respect and consideration for other people. But now the band has gone too far. It's total chaos now. Every man for himself, and the hell with everyone else. I'd never want to expose my kids to the type of behaviour that's typical on CB. The fact that many people defend this type of lawless, no respect behaviour, says more about the state of our society in general, than just a CB problem.

There are several things going here, and I will try to answer your questions. The amplifier on your stereo amplifies anything that gets on it's wiring system, so it must be working well. First, There probably is something you can do at your end to kill the interference, but you need to try and locate the source of the noise first. This goes to the second question. The interference you are experiencing may or may not be legal. It depends upon its source. Remember that your stereo is a Part 15 device and must tolerate any legitimate outside interference. When you start screwing around with amplifiers and speakers, well, things happen that the manufacturer didn't anticipate. Yes, contact your local amateur radio organization and they can help you. I'd give you more direction here, but you didn't indicate where you live, and you used one of those >>FAKE ADDRESSES<< that we all love, so it isn't possible to send info to you directly. If the noise is fairly continuous, it is unlikely that the source is either CB or amateur. Good possibilities would be the CATV system in the area, local cell phone/pager systems, industrial comm systems....

please@post.com wrote:

> I have a amped-up radio in my car. (I know I know....I don't play it that loud.)   I have been getting really bad interference when I am around my home. Anytime I am about 2 blocks from my home I get what sounds like garbled talking BOOMing through my stereo. Sometimes there is no one talking just a loud silence that sounds like it will bust my speakers.(hard to explain)   I get a little on my home stereo but I can't be sure its the same thing.

Close proximnity to another transmitter running legal power would never have affected your rig the way it did. Open the box and check to see if any of the components appear to be fried; it may have wiped an ic/transistor in the receive section.

This is another good example to prove that guys who run excessive power levels never bother other CBers. =:-)

It has nothing to do with legal or illegal radio operation. The CB and Ham bands are a reflection of the moral decay of our society. Everyone for himself and screw the neighbors wife.

The professor is going to have to sell his radios, then his TV's and eventually move to the mountain top to escape it. But the mountain tops are getting crowded so he better hurry.

Ok here is the deal . . .

Tell me where . . .

I will fly to the location

rent a pickup truck w/fiberglass camper shell

you supply me a radio 2 watt dead key min . . .

I will supply the rest of the system

no batteries, no altenators

and no antenna (aerial type)

I will take your system out within the 10 second window
and you will dig deep in your pockets to key again

We must invite TollFree along for the video as well as referee
LOL

Brass

shhhhsss toll

Hello all!
I was wondering if anybody worked the Island of Grenada this morning around
7:30 central time?
I listened on 27.385 LSB (Ch. 38) before leaving for work, and I heard a
station calling CQ DX with a "West Indies" accent.
I was surprised that I was able to reach him with my stock 148GTL.
I've worked the West Indies before, (Puerto Rico, Jamaica, Bahamas, Etc.) but
I've never worked Grenada before. It was pretty exciting working an island I've
never worked before. Being heard that far away with a TRULLY STOCK 148GTL made
my day, let me tell ya!!!!

Thanks for reading my babbling, I had to tell someone!!!

Hello Bronco Dan: It sounds like the first transistor in the receivers
front end called a RF Amp, might have been damaged or burned up.

The transistor should be easily replaced, and protection diodes added to
protect the receivers front end first RF Amp transistor.

I had a old Johnson 123, that would smoke off, even when the wind
changed direction. But after installing the protection diodes, it never
blew up again. A good Tech should know how to fix this for you.

Don't pay to much attention to Glen or Gary, I'd bet they would complain
ifin they was to be hung with a new rope.

Jay at jay123a@qnet.com .... Listening to Rock & Roll music in the
Great Mojave Desert, just down the road ah ways from the fillin station.
A good friend to Big Bob, famous CB'er and flossifier. Big Bob would
says things like: "Even ifin some folks got new clothes, a fine shotgun,
and a full jug, like in Hillbilly Dave's web site, they would be ah
complaining as if whinin would pay the bills"

> energy.

The problem with that is that it's only true in theory. Reality paints a different picture. Most S-meters are wide open at the low end and compressed at the high end. In other words, an extra 10 watts when you're already running a hundred may be all it takes to raise your signal an s-unit when you're at S-0. On the other hand, it may take 10 times more power to raise your signal from S-8 to S-9. And, when it comes to getting on top of a pile-up or even a two signal heterodyne, a mere 25 extra watts when you're already running 100 is all it takes.

Too many people simply regurgitate book theory without ever testing it. I used to be guilty of that. Other guys like me used to tell guys like you the same thing I'm telling you. The reasons why some things that may seem like myths to you never die is because they really aren't myths.

Congratulations,DX is the funnest part of radio for me,and one of the
2 main reasons I got my xtra class amateur ticket.Lots more DX,lots more
freqs,more modes,cooler rigs,and a lot more organization.
I specialize in collecting QSL cards from islands.Many of these islands
are uninhabited and a few operators form a "DXpedition"to get the island
on the air.So far after about 4 years I have about 196 countries
confirmed with a card.
  I still don't understand why CB DXing is not legal,oh well.
    Keep having fun!

Bill,

First of all, I wrote this:

Keep in mind that to raise your signal by one s-unit you have to increase transmitter power four times to pull it off!

To which Sharon answered:

Ya know I've tried to tell people that. That anything over 100-150 watts is a waste of time and energy.

And further more, this is more than theory, it's a matter of simple physics and mathematics! Just because calibration and circuit design will not allow analog or digital signal strength meters to read accurately does not render the above statement incorrect! A 3 db increase in power output is realized every time power output is doubled. The fact that "Most S-meters are wide open at the low end and compressed at the high end" doesn't change this law of physics, it simply makes it impossible to see a direct correlation between actual power output and s-meter readings. (The standard unit of measurement for the s-unit is 6 db.)

These analog meters can be made to read with a fair amount of accuracy when properly calibrated with an rf signal generator!

Jack

Check Sams Photofact or service manuals for generator calibration voltage and meter reference levels!

Bill,

Note also:

Improper setting or adjustment of the Automatic Gain Control circuit in radios similiarly equipped will also destroy the dynamic range of the receiver as well as providing inaccurate s meter readings!

The proper adjustment of the AGC assures that the receivers audio output remains constant over a wide range of receiver signal input levels. I have noticed over many years that most so-called CB Shops simply run this adjustment wide open because it results in what they perceive to be an overall increase in receiver levels, while at the same time completely destroying the dynamic range of the receiver in the process, the end result being that nearby signals cause "blasting" and adjacent channel rejection goes to hell!

Jack

Not this morning, on 27.345 AM some evenings we get a lot of skip from
the that part of the world and I have worked much of it on my Cherokee
CBS-1000 barefoot doing 4 watts. I know most of you guys like to run
power, but it is amazing to me what you can do with 4 watts. I have
worked Europe, South America, Canada, and much of the US on 4 watts. It
is a real challenge and accomplishment to do that. Talking skip on 4
watts is one change I wish the FCC would make in the existing rules.
Have a great day! Jon.

Their is usually a back to back set of germaniums in the RX section to blow
to prevent the rest of the RX section from going..
```

Or, if you have a PIN diode switched set (rare), then you might have those blown.

Depending on the radio, it could be easier to just replace it.

Hello Glenn: Yes I must agree with you. I stand corrected. I must have rolled your reply in with Gary's.

Maybe I thought the answer should have been more to the pointing to the receivers first RF amp transistor, not just the closest transistor to the antenna.

Dittoing your response, I'd disagree with. Giving a more accurate, more better, and more bittchenerr response, yes I did.

Jay in the Mojave

I was curious if you could build me one of your super amps, I would like to get a 91 pill, I dont need no combiner's, just tie all the inputs & outputs together. Also is there any way you can invent me your own style of biasing for the transistors? maybe a class Y2K configuration, that way it will be ready for the future. Also dont worry about efficiency, I have a big Cadillac alternator to power this puppy. And can I drive this with a galaxy 30?

Damn 10 ohm smoke
Sure make you choke
Da more dat smoke
Da more ya broke
Damn dat 10 ohm smoke!!!

Their are a couple things that you do to the input.

I redo the variable circuit to get the thing to act as a modulator. This will increase the PEP values, while still being able to run full throttle open for SSB use.

Then, redo the power wires, and that will give you a hundred or more watts alone.

Take the fuses out of the back and bypass them. That is worth more than 50 watts under high drive conditions.

Their are other mods, but those should be done by people with the proper test equipment, as they involve tuning the amps (each is a little different) for the best performance.

That entirely depends on the amplifier.

The amount of capacitance and turns on the output transformer (and to a
little bit, the material the transformer torroids are made of... Mix)
delegate the max volts.

Yes, it is.

The amateur (read that as the ARRL) community has a lot more money than the CBers...

The ARRL has good reason to keep the CW their... It makes it so that someone has to accomplish something before they could get HF rights.

If they opened up a No-Code hobbyist band, then what good would the ARRL be?

And, do you think that the Boston Tea Party was done while they where
petitioning Parliament?

Jack,

Sounds like I hit it on the head; down to your pulling out the
dictionary. The definition from your posts seems to fit very well.
What I was getting at was that it had already been established that the
949 and the 959 had the FCC labels on the back. Perhaps you question
whether Galaxy is putting fake labels on the back of the 949 and 959.

Anyway, Lighten up Jack; leave your socks in the middle of the floor one
time just for the heck of it. Have a great day! Jon.

Agreed on all parts.

I never operate above 27.9, just because I don't want to interfere with 10 meters (I have a 10 meter neighbor that says when I operate on the extreme high end of the band I take out the area he works...?)

I like all three services.. CB, Amateur and the "freeband".

Can't we all just get along?

I agree completely. THAT is what ham radio is all about.
Getting a ham ticket doesn't make one person better than
another--it just opens doors into other areas of the radio
hobby.

> its funny but I hardly ever work VHF and yet I have 2 repeaters operating

If this is aimed at me, it'll never happen because I'm
not licensed to operate on 14 megs--and I don't bootleg.
You and I will have to communicate via the Internet. My
e-mail door is always open.

There are a number of antennas that are supposed to beat the mighty quarterwave. Along with the Xterminator is the Stargun "Bopper" among others. I feel the same way you do; I need to see it to believe it. I'm on the west coast; none of these antennas are commonly available out here, so I don't see them and never get a chance to evaluate them. If I did, and found that they were better, I'd wouldn't have a problem admitting it. I'm not particularly in love with the quarterwave, it's just that I've never personally seen anything that's any better. Keep in mind that cost effectiveness plays a part in my equation. Some of these "high tech" antennas are very expensive when when compared to a $15 quarterwave. The question I often ask is whether these "better than a quarterwave" antennas are so much better that they should command prices that are 5 to 10 times more than a quarterwave. Even given the claims I've heard, I can never say "yes" to that question. In other words, in the bang-for-the-buck catagory, the quarterwave is still the hands down champion.

I'd like to know what that is too. I hope it's
not what I think it is (bypassing the modulator).
I've seen that done to 2950s. It gets you some
higher output numbers, but it's a radical mod
that I don't trust. The radios that incorporate
it tend to be unstable.

You can honestly say that about any of the older Cybernet radios!

Install one of Lou Franklin's channelguard kits and they where pretty good, though.

I prefer the 500 as a stand-alone amp (no modulator either built-in
like the 667 or outboard). The 500 by itself has tremendous gain and
good linearity. In other words, it sounds excellent with just a radio
as a driver because you're only running one linear amp stage (more
amp stages mean more distortion), and the amp is AB biased (no class c
modulators to add distortion) or extra built-in AB class driver
stages (aka the 667) to add extra stage and overdrive distortion to
your SSB sound. In a nutshell, the 500 and a sweet-sounding, hi-end
AM/SSB radio is a helluva nice package for the majority of CBers.

Let it never be said that the old professor doesn't give the best deals around!

Brand New in unopened box. Will modify if requested for no charge.
Price includes shipping via UPS ground within continental US.
$350

These are excellent (if not the best!) units with one driving four. They are class AB and designed to work great on SSB. The output expected should be around 550+ Watts peak.

Email me to make arrangements...

Judging by what he said, he is a complete idiot.

Look at the posts he has made where I ripped him apart on a technical issue..

He doesn't even understand the theory behind bias and a push-pull circuit.

What makes it bulletproof is not abusing it by demanding too much
out of it.

To me, "bulletproof" means reliable. Reliability and maximum possible
output are diametric opposites. Just because a 4 pill can make 1600
or more watts in competition, you shouldn't expect anything like that
in daily, low-voltage use. 667s make 500 to 550 peak watts at 12 volts
with 148s driving them. Don't expect more than that, and you won't be
abusing your amp.

It'll sound as good as your radio sounds--that's the point of running a 500 with only a radio as a driver. The point isn't to get every peak watt out of the amp, it's to make alot more power than you had using a 225 and to actually sound better and be a more reliable set-up. E-mail me. I'll send you a 500 on a trial basis. If you don't like it, send it back. All you'll be out is the shipping unless the amp is damaged to the point where it can't be sold as new. In other words, if you can afford it, do it--you won't be disappointed. There are others that sell 500s for less than I do. If you're ready to make the commitment, buy from one of them. My deal means you have to pay my price plus shipping both ways before I send you the amp. If you like it, I refund half the shipping price. If you don't, when I get the amp back in resaleable condition, I refund the purchase price of the amp. In simple terms, you pay the shipping both ways plus any damage you do to the amp. That's the best I can do. I really believe in the Texas Star 500 or I wouldn't make an offer like this. The smartest thing for you to do is to just go to a place like Exports R Us and buy one as cheaply as possible. Given what I've offered you here, you know for a fact you won't regret it.

I have seen 800 watts out of mine in daily talking for about 5 years.

Would that be reliable?

It will also do 1100 or more, but that is for short keys...

Toll Free

What's a Cybernet radio??

> Install one of Lou Franklin's channelguard kits and they where pretty
good,
> though.

For my Midland 79-290, I already considered the channelguard.  I was told
that it would not work in this radio as it is not modifiable in that area, a
real shame.  Do you know otherwise?

Dale.

I agree completely.

My whole point is to use it as a stand-alone amp because it'll sound great and produce impressive (and reliable) output numbers.

Here's how it works (mark my words here): anyone who isn't using anything bigger successfully (and I mean successfully--there are alot of bigger systems that just don't work right floating around) can upgrade to a Texas Star 500 and will be guaranteed greater CB success regardless of what success means to that person. Think about it. My offer extends to everyone. I sell 500Rs for $375--they're worth every dime. You send me $375 plus $30 for insured shipping both ways, and I'll send you one on a 30 day trial basis. If you don't like it and you send it back, I'll send you your $375 as long as you send me an amp I can sell as new. If it has holes or scratches or doesn't test properly (I have all the test equipment and know-how--you won't fool me) I will reduce your refund by the amount it takes to repair the amp. I don't work cheap, so it's not in your best interests to abuse the amp. This is also a Black Market deal so just assume that I have more muscle on tap than you do. You send me back an old pile of shit you won't get a dime back. You get pissed about it and knock on my door, I'll personally beat you with a baseball bat. I have a zero tolerance for scumbag losers who try to beat the system. This is an honest deal as far as Black Market deals go.

The point of all of this is that the Texas Star 500 is a great amp, and that every serious CBer should have at least owned one at one time. You can't lose on this unless you're successfully running a bigger system right now. You can also buy one for alot cheaper than I sell them for. I recommend that you do that. You have to believe that they're good. That's the whole point of my effort here. I'm telling you that you can't lose by buying one.

I really don't want you to buy one from me because I only like dealing with walk-in (local) customers. I'm begging you to buy one, but not from me even though I sell them--what could be a better testimonial?

73 to all.

If there new the GrantXL is your best bet its a better radio. If there used
then and older i would go with the Cobra they were hand wired then and had a
better recieve then. the Grant will tune up better than the Cobra
as far as output goes. Hope this helps  73s Oldtimer

I think the 520 is a little better deal.The 520 has a noise blanker,pa
and ext. speaker jacks where the 510 doesn't have. I do also agree with
the other fellows response about the 510 though. 510&520's are both
good. I have sold many of each.
```

  I do want to add though be carefull with the refurbs as there is only about a $10.00 savings and 1 one month warranty.

  The refurbishing is done by some outfit in California that does car stereos,scanners,cb's etc. They don't come with the original box and come with either a photocopy manual or sometimes none.

  My suggestion is New Product. Mike.....

According to federal law, it is.

That was the reason that Video Inversion was considered "Undecipherable"
during the cable TV heyday..

Although you could just tune a couple Kcs away from the center of the
carrier freq and get a useable picture...

Not a great one, but useable.

This was also illegal, as it was considered "Decryption and theft of cable
tv signal".

Toll Free

I'll reply in terms that apply to CBers in general.

As far as power output with solid-state amps, Class C (unbiased) works best. With SSB, Class B works best. Some may say that Class AB is better, but that's only because they haven't seen the latest, leading-edge research. On the other hand, Class C (technically unbiased) will produce a readable signal even on SSB because unbiased solid-state CB amps do not run with any applied negative bias which would make them true Class C amps. See how complicated this can get?

In a nutshell, for SSB use, you're better off with an amp that's biased into linearity. That means at least Class B.

This doesn't even skim the top of the huge iceberg that makes up the debate that's been going on as long as I've been out here (3 years) about amplifier class. That's why the big guns out here (including myself) don't even want to get started on this again.

Here's the scoop as far as CBers are concerned: The best amplifiers (Dave Made, etc.) run in Class C (unbiased) with a driver stage to produce more modulation. On SSB, the same amp switches to Class B or AB and bypasses the driver stage to increase linearity (accuracy of amplification) and minimize distortion. This assumes amps of no more than 8 transistors in the output stage. See how this works? No bias (technically Class C) and a ton of drive and DC supply voltage are the keys to doing well on AM. On SSB it's an entirely different story. The drive has to be reduced and the bias has to be present for an amp to sound as best it can on SSB.

This may be confusing, but it's the best I'm willing to offer and back up (undoubtedly I'll be challenged).

You "Tinker" but you don't know the price you ask others to pay in order to play your game. This is a complex newsgroup where arguments and debates flare up over the most minor points. What looks like a simple question can blow up into a huge argument/debate.

O.K. I've read all that you and Toll Free have had to say about this. Texas Star 500 is one of the best for someone like me who does not want to have to go out and spend a lot of money on extra voltage, wiring and all that other good stuff.

What would you pair this amp with. I've used Cobra's and Galaxy's but am open for suggestions. I got out of CB'ing here in my local area because of all the wild ones that tear up the channels but I sure have missed it and am considering jumping back in.

Last setup I had was the Galaxy 73V, Palamar 650, Wilson 1000 mag mount. Was happy with it but I did have problems mentioned in previous post about amp not wanting to unkey. {real pain in the ass to reach back and turn it off and back on just to talk).

Thanks.

Some may say that Class AB is better, but that's only because they haven't seen the latest, leading-edge research. On the other hand, Class C (technically unbiased) will produce a readable signal even on SSB because unbiased solid-state CB amps do not run with any applied negative bias which would make them true Class C amps. See how complicated this can get?
>
> In a nutshell, for SSB use, you're better off with an amp that's biased into linearity. That means at least Class B.

>
> Here's the scoop as far as CBers are concerned: The best amplifiers (Dave Made, etc.) run in Class C (unbiased) with a driver stage to produce more modulation. On SSB, the same amp switches to Class B or AB and bypasses the driver stage to increase linearity (accuracy of amplification) and minimize distortion. This assumes amps of no more than 8 transistors in the output stage. See how this works? No bias (technically Class C) and a ton of drive and DC supply voltage are the keys to doing well on AM. On SSB it's an entirely different story. The drive has to be reduced and the bias has to be present for an amp to sound as best it can on SSB.

Yep, I plan to BE MYSELF instead of getting everyone upset @ me. I found out that it is not fun to keep "hashing n' trashing" OLD NEWS. If people on here want to act up or cuss this is their business. Besides I do not know if it was you or someone else, but someone told me they do not like people that talk about the same thing all of the time. I am not saying that I will stay in the group. Just checking in to see if there are any replies, & to try to be "funny" with that 'pick the nose bit" if it is not funny then I am sorry.

If you like the Galaxy line, the 88 is about the best.

If you like the legal line of CB radios, then the Uniden 8719 chassis (148,
Grant, etc.) are the best.

I typically see more Bird watts from a Cobra 148 than I do a Galaxy, but the
Galaxy will do more on SSB clearly.

NOW MTV really "SUCKS" & I am trying to get them off the air & the FCC is
looking in to them. Remember DC101 & the "grease man" all the trouble he got
in to for cussing & talking about sex on the air. Maybe this is were
everyone got the idea to mess CB RADIO up. Can we CBer's sew him for that?

Doesn't really matter to me. I can say, even if it isn't right, the Galaxy helped here in my area because of all the clutter. I could find a channel to talk on without excessive bleed from other people nearby. And there were enough with SSB that even there they sometimes managed to screw it up.

Bottom line, one time purchase, best setup available without having to rewire automobile, and ability for SSB and possible others.

Off the subject or to change the subject. Can the Galaxy be used as 10 meter after conversion. If one should ever have a desire to get licensed.

If the wattage is changing with frequency, you're not running into a dummy load and you should expect increased inaccuracy.

If you hear a whine when you accelerate, one of two things are happening...

A. Your battery sucks.
B. You have a bad ground somewhere.

You should NEVER have to use a noise filter to get rid of a whine in the alternator (which is what you are seeing.... Not ignition noise. Ignition makes a popping sound. Alternators whine.)

I have a Texas Ranger 696F ssb base for sale. It has been modified with
extras. This rig has a six digit freq counter, talkback, a 5 tone
doorbell added , and an open clarifier. I have all reciepts for this
radio. I bought it new 5 months ago and hardly used it. This rig has
maybe 10 hours of talktime on it. I am asking 300 dollars with shipping
costs included. I spent 350 just for the radio from Copper Electronics.
Thank you all for looking at this ad. Email me with interests or
questions.

Yes, the Galaxy's will cover the entire 10 meter band down to 25 megs.

If for some reason you desire 12 meters, 11 meters and 10 meters, and a better RX section, get one of the Connex 4800DX radios, or the Cobra 148 Export radios (The 12 banders).

They have a new board in them that is supposed to kick ass.

Toll Free

You haven't read all the recent posts on this subject. The
dual final radios (10 meter/exports) are a great match to
the Texas Star 500. In my neck of the woods, it's like
bread and butter; you buy a big Galaxy or a 2950 and the
natural match for it is a Texas Star 500. The same goes
for the guys who know what the hot AM-only radios are
(Uniden 66, 76, Cobra 25, 29).

> I've used Cobra's and Galaxy's but am open

Nothing has changed. If anything it's gotten worse.
Don't get back in if you think the trouble makers are
gone--they aren't.

> Last setup I had was the Galaxy 73V, Palamar 650, Wilson 1000 mag mount. Was
> happy with it but I did have problems mentioned in previous post about amp not
> wanting to unkey. {real pain in the ass to reach back and turn it off and back
> on just to talk).

The amp was unstable. This time, buy a stable amp like the
Texas Star 500, a Messenger M4V, or a good custom like a
Dave Made or X-Force M200. Also, make sure you have enough
charging system to cover it. For the amps mentioned we're
talking a 100+ amp alternator at least. A real antenna
ground (not a mag-mount) helps tremendously too. The rule

is that serious, hi-power CBers NEVER use mag-mounts.

To make sure the amp is stable, put an SWR meter right at the output of the amp. Make the SWR as low as it can be with the amp off, then turn the amp on and recheck. The SWR will almost always rise, but it shouldn't be in the red (above 3:1). If it is, the amp is unstable and you'll have to figure out why and correct the problem before you use the amp. I can help you with that, but I'd rather do that via e-mail as it can get complicated. One of the obvious reasons is that your antenna (aka RF) ground is inadequate because you're using a mag-mount (remember your old system and don't do that again).

Some may say that Class AB is better, but that's only because they haven't seen the latest, leading-edge research. On the other hand, Class C (technically unbiased) will produce a readable signal even on SSB because unbiased solid-state CB amps do not run with any applied negative bias which would make them true Class C amps. See how complicated this can get?

The antenna you are talking about is made in Spain I believe, it is piece of junk, it will fall apart on you and a lot of the parts will crack, and yes it is 32' long for about a month, until the stinger falls out on the ground, I have heard ALOT of bad reports on these. They are nothing like the sigma 4, only in looks from the ground.

Damn 10 ohm smoke
Sure make you choke
Da more dat smoke
Da more ya broke
Damn dat 10 ohm smoke!!!

I notice everyone seems to like the TS 500v. I do too, as I have used one the last two years. My question is I am wondering what the opinions of the Messengers are now days. I am seriously thinking of getting a sweet sixteen but am also considering the 8 pill Messenger. Anyone have any experience for my comparision. I will put it in my truck, PU, with dual batteries and a 175 amp Alt. I use #"0" welding cable to connect the batteries and #"2" welding cable to connect to the amp which is behing the rear seat in the 4 door dually.

My radio is a 2950 and sometimes a 2510. I am not as much interested in every last watt as a good clear signal on SSB. Thanks in advance.

Now what is the big deal about putting the Ham's down? "Most" ham operaters on the proper equimpent, as we know there are some that don't. FCC mostly takes care of them.

I would have no problem if the serious 11 meter ops were to clean up Children's Band, and/or 11 meter.
I wouldn't mind if they went back to the old setup, as in issuing license to every CB user(or hopefully all 11 meter). I am getting sick of all the bad stupid language, for no reason.

So is there a webpage that sells these antennas ? I want to see if it will
outperform my 102" whip.

Well, if they were still making them, I'd say go get yourself a Turner M+3 or JM+3. In my opinion, it is probably the finest preamplified mobile microphone ever produced. They still pop up for sale (used) from time to time at hamfests and on Ebay. As far as new mics.....I'd probably go with one of the astatic models.

The info below is informative but there is a problem still; digital
phones transmit digital signals, these signals can be detected but
cannot be heard on a scanner (it sounds like hash). They need to be
converted back into the analog format to be heard, how can this be done?

i am going in the hospital tomorrow, (wed 9/22/99), so you RF police will have
free run for about a week or two and you out-banders will be on your own.:):):)
carry on the fight you guys and i'll be back soon to pick up where i left off.
this is NOT a threat but a promise. this fight is getting so old that this will
give me time to recharge my batteries and reload the old humor weapon.
the only regret that i have is that i'll miss a lot of the funny posts that
will run off the bottom of the post list from the RF police that have been so
hilariously entertaining.
have fun.

Hmm, scambling yes, encrypting no. I wouldn't call taking an analog
signal and simply inverting it encryption.

Your experience in today's world has only just begun, Mr. Van Winkle. The
language on TV programs will "blow you away". You will not be comfortable
watching movies other than G and PG-13. And don't ask for a translation of the
lyrics on MTV.

Oh, one more thing. Automobiles now come in colors other than black.

If you have a Wilson 500 and it doesn't work right, there is the clue
right there that something other than the antenna is wrong.  The 500
should work nicely.

"Class" has to do with the biasing of the amplifying devices (either
transistor or tube). If you really want to learn more about
amplifiers, get yourself a copy of "Sam's Radio Handbook" by William I.
Orr (W6SAI). It covers many other topics as well. Class A amps are the
most "Linear", but are inefficient, produce a lot of heat and are cost
prohibitive. Class C.....well, I won't even go there! Class AB offers
the best balance between "linearity" and efficiency and is the class
employed in most "top shelf" Amateur amplifiers today.

"Toll Free" is absolutely correct here. Class has to do with the
biasing of the amplifying devices, not the "configuration".

The original company does not make the antenna any more, in fact I do beleive that the original
company has long passed. There is another company that makes an imitation Sigma 4. Don't remember
the copycat name they put on the antenna though. I saw one when they first came out, and i have to
say "Splined aluminum radiator element?". Ok I guess. AFunny as to haw I listen to the radio but
never hear them brag about the antenna. I have heard a few indivduals off the air talk about how
they though they where a piece of ^%$#, but thats all hears say.

Asdfor MC Turner, I have a couple of questions to ask. Did you modify the antenna? For the fact I
have never seen a Sigma 4 over 28.5 feet long. 32 physical feet is more in the words of 7/8 wave
not 3/4 wavelength. Or did you modify the matching network drastically? or just add 4 feet of
radiating elemet to the antenna?

Hello Beedman007: R U kidding???? I have no problem drilling holes, removing the head linner, tearing out the insulation, removing the seats, pulling back the carpet, drilling more holes in the firewall, cutting up the new garden hose for added insulation for the postive 2 gauge wire, removing and replacing the battery mount, and battery, bashing the fender in to make battery clearance space, putting in a bigger alternator, bigger wires, back up battery, 150 amp shunt, and amp meter RTV'ed to the dash, duel 102 inch whip antennas, RG600 coax, and .... car or truck will look bitchen. You should see what I do to rental cars!

CB radio performance first, all that civilian look good crap last!

Ok Tube Guys I need some help.
I have this old Varmint Mobile 190XL that I need help on tuning. I am going
to put it in the combine and stay away from houses like advised earlier.
Here it goes, I am not familiar with tubes.
How do I tune/ setup this to my radio ?
On the bottom of the box there is two switches, which way should they be
positioned? Also there is an adjustment screw right beside it.
On the front there is a plate knob and a load screw , how do I set these up
?
I know I am being very vague about all this but it is the best I can explain
it. I am hoping that someone on here still has one of these or has had and
can help me set this up.
As it is getting about harvest season and I do alot of talking in the
combine late at night.
Thanks,
tinker

Bill,
There has not been any keydowns in Arizona. I do beleive that the one closest to you would be either San Diego in August.
You can check the calendar of events at

www.bigradios.com/tollfree/calendar.htm

I try to keep that updated with as much information as people will send me.

And for the RFEnforcer lawyer wanna-be's, I give you permission to look too. But be sure to read the first few lines on the page. I need not say anymore.

That more then likely sounds like alternator noise, One solution is to stop at
radio shack and get the snap on ferrite core, Im not sure how windings it would
take but put it on the power leads and the might just help get rid of the

whine, even stop it alltogether.

Digital phones transmit digital packets modulated just like a computer modem. If the packets were encrypted before they were sent, you'll never decrypt them if they are using a good algorithm. Same thing happens when you use your web browser on a secure site. The packets you send to the other site are first encrypted, then sent.

OK, I have a few questions about this amp.

1.   Does the bias change on any of the transistors when you depress
the SSB button for SSB delay? I can't see it in the schematic I have
but it might not match those amps exactly.
2.   What is the best average dead key power level drive for the amp?
3.   What is the best average power drive level fully modulated in AM?
4.   What were they thinking when they put the AM button (Green button)

on the amp? Was it possibly a bias mode switch that never materialized?

5.   Why is it so easy to experience modulation compression with this
amp? I see it
start around 300 W output power when driven with 2W dead key, using the
front-pannel variable control to set the output power level.

Any help with these questions and any other operation specific info is
greately appreciated.

John

>but it might not match those amps exactly.

In the case of all of the 667v's I have owned this will give you the lowest deadkey on the variable and will have the best swing when used with the AM button depressed as well
>2.   What is the best average dead key power level drive for the amp?

I use 2 watts. I have found that the 2290 driver works best at that level.

>3.   What is the best average power drive level fully modulated in AM?
35 -40 watts max is the highest I would use. I have found that you will burn out the variable pots faster at higher with higher deadkeays and swings. It has a driver it doesn't need to be driven

>4.   What were they thinking when they put the AM button (Green button)
>
This is the high/low button. Depressed is the low side. With it in you will typically find your deadkey to be variable from 0-300 watts. With it out dead key is variable up to 500. In addition to AM button in with the ssb button button in on AM you can vary your dead key 0-100
  I have had 3 of thes amps now and I could not be happier with an amp. Mine have served me faithfully for years. The latest one is one of the new ones and it out
talks either of my old ones.

I've had some luck with DX on barefoot AM, but I prefer SSB... I love running barefoot stock radios... It is a challenge because of all the noise and QRM from other stations, but I have a lot of patience, and when the time is right, I can work some pretty good DX. I don't even own an amplifier, just a Maco V5/8 on my roof, and a STOCK Cobra 148GTL.
Good day to all,   Jeff..

>I was surprised that I was able to reach him with my stock 148GTL. I've worked the West Indies before, (Puerto Rico, Jamaica, Bahamas, Etc.) butI've never worked Grenada before."

Get used to it, or at least for the next few years. The sunspot cycle is heading for a peak, and before long it will be possible to work most of the world almost 24 hours a day.

It's worth that 5WPM code test and tech written to get on 10 meters.

Looks like you've saved me the trouble. Nice of you to maintain a Web site which tells the FCC specifically when and where all these illegal contests will occur.

     You're probably fanning the heatsink and keeping the
     TX duty cycle below 50% because you know better.
     Your next statement supports what I just said.

     There are other variables that enter in to it as well.
     You know what I'm talking about.  What you just said
     sounds like something you blurted out before you really
     thought about it.  You and I don't represent the average
     CB amp user.  We can't use our personal stuff as an
     example.  Your 667 in the hands of a guy with a high
     antenna SWR that likes noise toys and won't shut up
     wouldn't last a month unless you leave the fan(s) on
     it, and the lack of supply voltage causes the collector
     current to drop back into the safe zone for high duty-
     cycle use at a safe zone junction temperature.
```

```
> It will also do 1100 or more, but that is for short keys...

     By competition standards, 1100 is weak for a 4-pill.
     By daily-use standards, 1100 means sure death for a
     4-pill.  We both know these things and shouldn't be
     contradicting each other when there are so many other
     people out here that could use our help or REALLY need
     to be straightened out.

l did make a contact on that to the island on that day in the after noon and
mada a short contact . A little hard to understand but he was 5x9 , good signal
l think it was on 27.435 , lots of fun , Chris in Colorado . Enjoy the DX . A
little bad right now with all of the " south of the border crap " messing up
things but it will go away !

I need a handheld CB for some occassional use between offroad vehicles.
I can purchase the Uniden PRO350XL from their website refurbished and
like new for $48. Is this a decent radio?

Dave

Posting public information to a newsgroup... That's effective.

Please, tell me what the net result of all your "RFEnforcer"
efforts have been to date. My guess is ZERO.

You sound like a washed-out police academy cadet... Get a life.

> No it is on a switch.

The better dealers put SSB switches in the 225s that they sell. At the very least, they will cut the trace next to the delay capacitor to eliminate the delay for customers with AM-only radios. All you should have to do is ask.

> > How about the preamp ? Can it be used without the amp
> >turned on ?
>
> Yes it has a pretty good pre amp and it can be used with out the amp being on.

The Blue Face 225s don't have an independant pre-amp.
The XL series Blue Faces do. They also have a SSB switch.

> I saw a couple of replys to this that recommended you drive the amp with a
> modulator. You can do this with the 500 R,but Not with the 500 V (variable).
> You will find that you burn out the variable pots and the amp wont work right.

The "V," when on high (only the red "power" button in),
bypasses the variable pot. When running a modulator, the
amp should be running in the highest power position
where the variable pot is out of the circuit.

Hello techno freak's,

I'm searching a long time for the services manuals or a
schematic from the CB radio - Lafayette 2400 FM-HP, with
board nr (PCMA 032 A)
On board is a PLL 02a and this CB-Radio is with a high power
amplifier on the back. SSB power up to 50 watts.
Missing on board is Q-50 what is the type of this
transistor, perhaps an 2sa1012 ?

I do have an operation manual witch says, (Printed in Japan)
but if this CB-Radio is also made there, I don't now !
I also have an service manual from an Lafayette 2400 FM

```
but this is not the same as the Lafayette 2400 FM-HP.
Print type nr; of the Lafayette 2400 FM    is PCMA001s
Print type nr; of the Lafayette 2400 FM-HP is PCMA032a
I'm searching for the PCMA032a one.
This Lafayette 2400 FM-HP (PCMA032a) has many SMD components
on board.

Having a problem in the dc switch and can't fixed it without a
services manual. Do you have the services manual from this CB-radio.
Please let me now.

Otherwise can you help me with some info where this CB-radio is made
and some factory addresses as well.
You do me a great favor if you have some info to help me out
with this one.
I cant believe that this print type is used in just one CB-radio
and there is an great possibility that this type of print is also
used in other CB-radio's perhaps you have it.

Many, many, many, thanks in advanced and hope to read some from you.

To make it clear for you,
---------------------------------------------------
CB-radio                 ; Lafayette 2400 FM-HP

Yeah I started off with a junky Kraco (whatever), and that's lasted like 3 months. I then upgraded to a Messenger 123a, now that was a great radio. It was only 23 channels, but it works for a long enough period of time. My antenna at that time was a cheep rat shack, 5/8 wave, I believe. I then bought 3 Cobra 18'z, and used them a while. Now I um using a Euro 3900. This radio works, but there always room for improvement. Now my antenna is like 60 feet up, and is a dipole, with 3 ground planes off of it. I also am moving to a 3 element beam.

BlackCat, California...

> If you like the Galaxy line, the 88 is about the best.

The 2950 is a better bang-for-the-buck choice that does everything an 88 does for less except the TX audio effects. The analog meter on the 88 is better than the bar graph on the 2950 too. The TX audio effects and the analog meter can be added to the 2950, but the features that the 2950 offers that aren't on the 88 can't be added to the 88 because the 2950 is CPU (central processing unit) controlled while the 88 is not. To me, that makes the 2950 a better choice.

> If you like the legal line of CB radios, then the Uniden 8719 chassis (148,
> Grant, etc.) are the best.

If it weren't for the Midland 79-290 I'd agree.

The 79-290 somehow slipped through the FCC cracks (that should excite all the legal beagles on the negwsgroup). The 79-290 has an FCC type-acceptance number, therefore it's a legal CB. However, it's a dual-final, high-level, AM modulated radio that always does more than 4 watts AM (average) and 12

SSB (peak). The coarse clarifier is unlocked in the stock configuration too. To add 5 extra bands of frequencies all you have to do is solder jump two points in the control head--you don't even have to remove a single screw from the radio itself. The coarse clarifier is already unlocked, so you'll have full coverage. Remove Q33, tune one coil, and adjust a few pots, and the radio will dead-key 2 and swing to 30+ and 35 on SSB at 14.5 volts. The stability is excellent even when tuned-up. That means the radio doesn't freak out when running an amp into a high SWR or a mag-mount. The small size and modern look will appeal to many people as well. The price is good too, considering how cheap the mods are. I'll completely set-up a 79-290 for $40. Compare that to $90 or more to do a Grant or a 148. The only thing that bothers people about the 79-290 is that it needs a continuous power source or it loses its memory. A number of people have contacted Midland about that and were told that it's normal. That can be an annoyance; but, all things considered, the benefits of the 79-290 DEFINITELY outweigh the drawbacks. I've been in CB for 20 years--I like the old standards like the Grant and the 76. But, if I had to buy a new "standard" CB right now, I'd buy a Midland 79-290.

> I typically see more Bird watts from a Cobra 148 than I do a Galaxy, but the
> Galaxy will do more on SSB clearly.

That's not what I see. Most Galaxies are dual final radios--that means they naturally make more power than the single-final standard CBs. The AM-only Galaxies have audio output transformers. That means they get the advantage of an autotransfromer effect which raises their output to more than can be had using a transistor-based modulator stage such as is used on the 148. The 148/Grant chassis is one of the weakest TX performers still in production, in my opinion. They're the reason why amps like the 667 are still available. The 148/Grant is a throwback to 20+ years ago when no CB radio made more than 15 to 18 peak watts. In those days even the AM-only radios that had audio output transformers were weak because they used such low-power RF driver and final transistors.

Maybe I misunderstood something.

I agree. What's worse is that the amp can't stand
that for very long and will fail. That results in
down time and an expensive repair.

Boy, I didn't know that. I was going to recommend the
2950 or the Lincoln as I know they'll do the entire 10
meter band including the high end where alot of FM repeater
activity is starting to sprout up. Will the Galaxies do
offsets and PL tones? As far as I know, those things are
still the domain of the 2950.

In almost all cases you can go 18 volts when the amp is unbiased (technically Class C). 18 volts is the C-E breakdown voltage for most 12 volt RF power transistors. The amp's stability is much better when unbiased (running in what's commonly refered to

```
     as Class C).  That allows you to get away with higher
     supply voltages and AM drive levels.  The top of the
     transistor design curves are 16 volts; that's where
     I would stop with a daily-use amp that might see bias
     and/or hasn't been re-resonated for higher voltage use.

I guess that's as close to a compliment as you get.  I suppose Toll
should feel blessed.

The problem is that you haven't added ANY leading edge information
to this newsgroup.  If I'm wrong, tell me.  List the leading edge
info and/or secrets that you've cut loose with since you've been
out here.

It's easy to bitch, criticize, and then list a bunch of callsigns
at the end in an attempt to make your opinions seem more qualified
than the next guy's.  It's alot harder to prove that you're anything
more than just another average tech.  A picture of you at a cluttered
bench isn't enough.

Toll, some of what you're saying here is wrong.

Dig out your old books and review.

If you keep writing posts like this, you'll force me to jump in and
correct you--I don't want to do that. You, I and a couple of others
are the last of what I call "the old guard." We should be teaching,
not arguing amongst ourselves.

Chris wrote:
>
> I have a Silver Eagle 200 and was wondering what class amp it is?

It has no applied bias.

Since the transistors need .6 DC volts on their bases to cause collector to emitter current to flow, and that the .6 volts isn't supplied by an external bias circuit in your amp, most people will call your amp a Class C amp. In a semantic sense they're correct. In a realistic sense, your amp trully operates just on the Class C side of Class B--which is a LINEAR class. That's why it produces a useable SSB signal.

Chances are you're confused--that's not abnormal. VERY few people on this newsgroup really know how to classify amplifiers. Most who think they know are simply regurgitating things they've heard or read by people they thought were smart and/or infallible.

Just as the subject says is it possible to paint an antenna without any effects? My girlfriend came up with a ripping paint scheme for my new antenna and I was wondering if paints would throw anything askew. I know some colors have different traces of metals in them, would the antenna change after application? Has anyone even tried this or am I the first person with a crazy idea? I would like to hear everyone's opinion.

Hello ODVTATDL: The reason the Francis Amazer is 96 inches long, and not 102 inches long is, the energy travels a little bit slower in the fiberglass antenna as compared to the stainless steel whip. I have talked with the folks at Francis, the 96 inch fiberglass is electrical equivalent to a 102 inch antenna.

Most antenna type ah guys figure the antenna lengths at 5 % less than what the formulas call for.
So if you use 233.6 and divide it by 27.0, you get 103.8.

The spring will make the antenna longer, resulting in working at a lower frequency.

Jay in the Mojave

Get out and don't come back, you idiot half whit.

We never asked you to come here, never wanted you, and never liked you. We have a newsgroup that we like. If you don't like it, screw you, but don't come and try to run our lives for us.

If you don't like this newsgroup, then go create your own. All you have to do is have the backing to do it, the brains to draw up a charter, and you are on the way..... If you think that anyone would follow you.

I am tired of you. Your an ass.

Good riddance.

Don't come back, ya liar.

The Sweet Sixteen needs a driver.
It is Class AB
It is a clean amplifier.
It will do app. 1400 watts with 100 watts drive at 12 volts (or thereabouts)
It likes app. 30 watt carrier

The Messenger 1200 doesn't need a driver, just a high drive radio (like yours)
It is also Class AB
It is also a clean amplifier
It will do the same 1400 (or so) watts, but with about 30 watts PEP drive
It is not as stable, as the driver stage is in the same case as the box.

I have both a Messenger Competition 1Kw (16 transistor amp) and a Sweet Sixteen. I can typically see more out of my sweet sixteen (after you half the output of the Messenger, as it is twice the amp) with the same drive (halved).

The Messenger is filtered on the output so it is somewhat cleaner spectrally. The Texas Star is not.

I like both the amps. I bought the Messenger from a close friend, or I probably would have bought a Texas Star 3200. The Messenger stuff is good, clean and reliable, but I can get a Texas Star so hot it will fry eggs, parts fall off the PC Board, etc., etc., etc. and they keep on going.

Cleanliness, run in accordance with the instructions -- Messenger
Balls to the wall Class AB output, still kicks ass -- Texas Star.

I also like the idea that I can run my sweet sixteen with no driver, and that makes a damn nice little amp.... 8 Pills at 300 watts output.

Your electric system will handle either of these amps.

Bill,

I retract my statement.

I was going by the current frequency spread, as well as the high end of an old Pluto "H" model.

Had an extra 40 channels in their! ;-0

And you are also right, the Galaxy does not have any of the "goodies" that the microprocessor controlled radios do, like offset.

If all you want to do is talk skip, the Galaxy will serve a person fine, in my opinion.

Really a matter of opinion,I use both and by far prefer transistorized
amps.I hate the tube amp because I have to "tune" it and I am lazy(auto
antenna tuner,digital voice unit to send CQ,etc.).If a person only used
1 narrow band this wouldn't be a problem but I would look for an amp
with some cheap but rugged tubes like 572Bs.Also many people have died
because of the high voltage present in tube amps.
```

With a good transistorized amp you just key-up and talk,if the SWR is dangerously high or the amp is getting hot,or you are overdriving it the amp will protect itself till you resolve the problem.

Their are a few personal things that I DON'T like about the 2950, nor the 88. I have one 88, but I don't run it.

I prefer my Uniden SSB chassis.

Bill, I don't do this everyday. This is a new chassis to me, although I have heard that the RX section sucks.

Sounds like a good radio. I would like to see one. Maybe when I am in Oakland next weekend, I will stop by and look at it.

You near a BART station? I am going to be on the Ankle Express, but if you are near a BART, I will stop by...

Anyway... I do like the 8719 chassis. I can see 10 watts Bird out of one fairly easily, and rarely see that out of a Galaxy, even when really pumped. The ones that mod a Galaxy for that many watts usually see a lot of them brought back in a month or so. I also like the TX audio that comes from one.

The transformer modulated radios where not in the equation because I was talking SSB only. For AM use, any radio that uses a transformer for the modulator works well.

>
> > I typically see more Bird watts from a Cobra 148 than I do a Galaxy, but the
> > Galaxy will do more on SSB clearly.

See my statement above.

>
> That's not what I see. Most Galaxies are dual
> final radios--that means they naturally make
> more power than the single-final standard CBs.

Not necessarily! You ever look at the dual final Cybernet chassis? They won't even hit 4 Bird watts! Shitty regulator design.

Galaxy is better, but I never see the even power application from the modulator section from the 148.... Due in a large part to the better voltage regulation of the Galaxy regulator / modulator. However, when a "swing mod" is done to the Galaxy radio, it sounds like shit. Not so with the 148.

> The AM-only Galaxies have audio output transformers.
> That means they get the advantage of an autotransfromer
> effect which raises their output to more than can be
> had using a transistor-based modulator stage such
> as is used on the 148.

I wasn't talking about the AM only chassis. If it was am only, then their are a LOT better transmitters than the 148. For a dual mode radio, I still like it.

The 148/Grant chassis is
> one of the weakest TX performers still in production,
> in my opinion. They're the reason why amps like the
> 667 are still available. The 148/Grant is a throwback
> to 20+ years ago when no CB radio made more than 15 to

Guess we see things different. Both mentally, and on the meter. ;-0

The Varmint box is a known splatterbox.

If you don't care about your neighbors, or live in the country, it will serve you well.

Their is close to 300 dollars worth of tubes in it, for 600 watts output.
For the same 300.00, you could buy a pair of 3-500Zs that would give you 2Kw PEP all day long, Vs. the 600 watts PEP the Varmint will give you, and with the Varmint you may be buying a new set of tubes in the near future.

If you want to run it at about 400 watts, it will last a good long time...
Anywhere near 600 or more, and you will be buying tubes a lot.

They are somewhat cleaner than the class C boxes, as Brewer used a good
amount of bias on his, but in the SuperMod mode, they are totally class C.

Hope this helps!

Agreed, and to be safe, I usually stop at 15 volts.

If you measure base voltage / idling current on a typical diode bias amp,
the transistor is WAY on at 15 volts...

Too close for comfort for me, but I have people that do it and have gotten
away with it for years!

When used with an Emperor 5010 in the mobile the SWR meter in the radio does
```

strange things.   With the amp off the SWR is 1:1 and the power meter reads 9. When the amp is on the SWR jumps to 2.5 and the power meter reads 2.   I tried a longer jumper,9 feet(original was 3) and didn't change much. Can anyone tell me what is going on?
By the way, I think it is an older model and shows 15-80 meters on the front.

In my opionion, they aren't the same anymore. In other words,
they suck. That's based on direct experience being an amp
dealer.

> I am seriously thinking of getting a sweet sixteen

> but am also considering the 8 pill Messenger. Anyone have any experience
> for my comparision.

I do. The Texas Star is nearly as stable and MUCH more powerful. The DX1600 would be my choice. The Messenger would work, but it doesn't have the gain and therefore the output of the Texas Star.

> I will put it in my truck, PU, with dual batteries and
> a 175 amp Alt. I use #"0" welding cable to connect the batteries and #"2"
> welding cable to connect to the amp which is behing the rear seat in the 4

That will work.

> My radio is a 2950 and sometimes a 2510. I am not as much interested in
> every last watt as a good clear signal on SSB.

Using only a radio as a driver you won't see every last watt, but your signal will be incredibly clean. Personally, I can't think of a better set-up. An eight transistor amp with a 10 meter monobander as a driver is a perfect set-up when linearity (accuracy of amplification) is the goal. The Texas Star 1600 has the most gain of ANY 8 transistor, solid-state amp including the high-priced Ham amps. In other words, the Texas Star is a better choice than even the Ham amps for what you want to do. If your antenna is properly matched to the amp, on SSB no one will know you're running an amp. Your signal through the amp will sound just like it would without an amp in the line. Isn't that the goal?--I think it is. Running conservatively, the amp will last a lifetime too--that's another important thing as far as I'm concerned.

> Thanks in advance.

You're welcome... I hope this helps.

I don't know if you're qualified to handle this or not, but there's
usually a pair of back-to-back diodes in the front of the receiver
to protect against super strong signals.  If one of those shorts
to ground, the receiver will not work.  You need to check and
possibly replace one or both of those diodes.

"John J. Gervasi" wrote:

> OK, I have a few questions about this amp.
>
> 1. Does the bias change on any of the transistors when you depress
> the SSB button for SSB delay?

No, but it should. The amp would be more effective
on AM if the driver was a Class C modulator on AM.

> I can't see it in the schematic I have
> but it might not match those amps exactly.

The old 550 schematic is still very close to the
latest generation 667.

> 2. What is the best average dead key power level drive for the amp?

2 watts if maximum output is what you're after.

> 3. What is the best average power drive level fully modulated in AM?

Maximum average with modulation is nearly unlimited.
The secret is to set the dead-key very low.
Considering the driver stage, I'd probably limit
the maximum average drive to 10 watts.

> 4. What were they thinking when they put the AM button (Green button)
>
> on the amp? Was it possibly a bias mode switch that never materialized?

The AM button switches in some input swamping resistance that
really helps to increase the stability of those amps. If you
don't believe me, run the amp with and without the AM button
in and measure the output SWR. It will be much lower when the
AM button is in. That means the amp is more stable.

> 5. Why is it so easy to experience modulation compression with this
> amp? I see it
> start around 300 W output power when driven with 2W dead key, using the
> front-pannel variable control to set the output power level.

```
     Because it's VERY easy to overdrive a one-driving-four amp.
     Do you understand what I'm saying?  The 500 is a 667 without
     the driver stage.  Do you know what a driver stage is?

In my opinion, the quality of Pirate amps depend on who you buy them from and what they know about CB amplifiers. If they know nothing, the Pirate boxes they sell are likely to be junk. The reason I say that is I sell Pirate amps and I know alot about solid-state CB amps. The Pirate amps I sell require work on my part to make them decent as far as I'm concerned.

The Texas Star DX1600 will outdo the equivalent Messenger. You have
a Texas Star 500; you know that it's a good amp. The 1600 is two
500s put together.

Go with the Star and get a good two transistor with a variable to drive it. Or a TS mod-v with a good swinging radio. You won't ever regret it. The strongest combo I ever saw was a TX800 on low stage driving the sweet sixteen. Radio being used was the Cobra 148fgtldx+ or connex 4800 tuned to 2 watt carrier swinging like 12 watts. Unit really talked local as well as dx with the best of them. The Tx800 is an older unit that on low would key 35 watts and swing to like 200 modulation at 13.8volts. Any amp that will do the same 35-150 drive would be a great choice to drive the star unit.

I find it rather funny that ham operators sit on freeband frequencies or ham bands and talk a world of shit about how dumb people are on those frequencies and then get on the 11M cb band and act all hollier than though try to preach proper radio operations and when they don't get their way they no long become part of the solution they become part of the problem. Now this is in my region where I listen to 26 MHZ to 1.3GHZ. So this is not a generalization of all ham operators.
God forbid some one here might take offense. I may not have a licence but I do have scanners.
Just because you retreat to the frequency that you think is clear there is always an audiance, remeber that.

Now, the reason some CB'ers, including myself get pissed at ham operators that come down or up to cb freq. is they take on that "I have a licence, therfore I know more about radios than you so sut up and listen." Now think about it hams you wouldn't give a lick of respect if someone started to talk to you like, right?

Example situation:
You come down to 11M and start to play prim and proper, and operate your radio like a ham station. I have noticed that cb'ers tend to think your trying to sound like your special. People don't like that. Try just going with the flow of the conversation. Come on If I can sit down at the flying J and actually have decent conversations with some of the hardest headed truckers.
You can do the same. Don't talk to them like children. Thats what give them the attitude towards hams.
Now the role reversal. sayyour having a conversation on the ole 2M and someone just got there ham ticket and starts talking on the 2M band like a cb'ers, lots of hams (not all mind you, but quite a few) would be lining up to take a whack at brow beating this individual. And I have heard this happen several times.

Now, for us cb'ers. Though I was going to try to make this post one sided. I think not. The problem with some of these individuals is that they just don't take it seriously. I don't mean drill sargent style, but theres no respect toward other individual. The "If I don't know you within my ring of cb friends you are the outcast, and don't talk on this channel." Thats a bullshit mantality to go with and you should shut up and listen.

The other problem is secrets, and I mean any body will sit out on the cb and wait for someone to ask for mods on a radio, and theres some putts just waiting , drooling at the chance to key up with that information. Just so they can sound like there a technical wiz at moding a cb. Just because Dr. Crank-ur-radio-up golden screwdirver cb tips and tricks book is at your side dosn't make you a electronics tech. CAn you read a schematic to actually see what effects that has on the radios circuitry. NO! I remeber when only a chosen few had amps. and kept it that way so no over bering fool could act like a ass and try to play cb god. Now, every body has'em and you need 100 watts just to talk to someone else 1 mile away.

And whats with these power jockey wanna be's that feel they have to key up with 400++ watts of power at NIGHT, of all times, to talk to a buddie 4 miles away! FOR CHRIST SAKES!!!!! there is a reason that Broadcast band stations, especially AM stations, reduce there power at night. Because the FREQUENCY HAS A LOT LESS ATMOSPHERIC NOISE, AND LESS POWER IS NEEDED TO BE HEARD AT THE SAME DISTANCE!!

Now one more group before I'm done with my rant. SIDEBANDERS AND AM'ERS THE GREAT DIVIDE. The reason am'ers don't talk alot on SSB is because they cause some select few am'ers cause so much shit on am and sideband that they are afraid to say there first name. They have spent so much energy hiding behind a handle and character that they don't want to divulge and personal info over the air. So you don't hear them up there that often. Now the ssb crowd considers themselves pretty much as ham operators with out a ticket, And a lot of them are ham's i can sit on a side band channel and findout what almost everyone on the freq. is running cause they don't hide the fact that they are running a Kenwood, Yaesu, or Icom. well now you ham operators using that radio for Illeagal operations. So get of free-banders ar criminals.

The one thing can be said about all bands decent conversation can be had if we try for it.

And to the average joe blow who dosn't know or care to know anything about radios,
just thinks
we are whackos that run around with big rods sticking off our cars. And I say
ham's, cb'ers, and
sidebandes, were all sill trash in the publics eye.

I fully agree.

>*A ham ticket doesn't make someone an authority.

Though 75% act like it when they talk on the cb.

>*There are good and bad people in both ham and CB.

Not bad just confused with mis-truths.

>*Illegal power sucks. A "big radio" does not make you a man.

Tell that to the ham that sat on the channel and played musical carriers and spewed slanderous
accuzations towards me for a three months every time I got on the air. Of course i got buddie,
buddie with him, as he was selling off some of his equip. then he was moving and needed money so

I bought his equipment, turned around and sold the equipment right in front of him and still
turned a profit from him, and his old equipment went out of state just like he did. And he was
pissed when i did that.

>*The "Freeband" is not free. If you don't like the law, change it.

Your right and I think the same goes for ham. They don't just get free roam of the spectrum so
stop acting like it.

>It's your right to disagree. But if you are going to disagree,
>at least have the facts.

Your right! And when some one starts calling you names in a discussion, the argument become a
lost cause, because it now has stepped out of a controlled debating form. To a different subject
of try to save face in public.

Newsgroups: rec.radio.cb

one thing that gits me is people do not understand what litle mening
power has in radio. a half way respectible radio will have at lest
50 to 60 db range from s1 to s9. all most all radios a calibrated to
50mv for a s9 reading or 100mv open circuit with a 50ohm signal
generator. with it reading s9 at that input that means that you can
reduce the input to 0.5 mv for s6 and 5 uv at s3 and 0.05 at s0
sinse ther most rigs have a 0.5uv at 10dbs/n sinsitivity that is why
i stated 50db to 60db becuse thay would have a range of 50 db
if somone was coming in a s9 you should be able to hear him
with 2 20 db attenuators inline if you can't than yor radio is deaf
becuse every person with a respectible cb can hear people
10 to a 100 times a weak as you

if a person is coming in at s9 with 100 watt carrier he can go to
1 watt carrier and still be s6 or go to a 10mw carrier and be s3
and a 1 to.1 mw carrier and still be heard
some cb,s i have tested run about 30 to 40 db from just readable
to s3 and about 15 from s3 to 36 and s6 to s9
if a person came in at s3 with 10 carrier he would nead to go to
300 watts to git to s6 and 10000 to go to s9
some recevers i have tried wer pathetic like some cobra,s
and two whistler,s and a uniden or two or three they ran about
6 to 10 db per every 3 s,units that means that my old realistic navaho
can receiver can hear people 500 times weaker than they can
another thing is coax becuse peaple think they don't nead to run
rg-8u becuse they do not run a kilowatt or more wrong!!!!!!!!!!!!!!!!!!!!
rg58 has 2 to 3 db loss per 100 feet closer to 3 that means that half
of the tx power gits to the antenna and half of the rx gits to the radio
and it is collective that means if the each person has 3db loss
than the rx signal will be 1/4 of the no loss level rg8u has 1 db loss
at cb so the same cb,s with rg 8 will have twice the signal giting to
the receiving cb not including connecter loss which varies on coax
used a pl259 with rg58 will have more loss than a pl259 with rg8u
not becuse of impedance bump it is becuse of a velocity and
diamiter bump the p259 was designed for rg8 with the same
dielectric id and center conducter id
the perfict connecter has 0.25db loss with rg8 and 1 to 1.4 with rg58
depending on the instalation job the connecter might have 0.7 to 1db
with rg8 and 1.5 to 2 db with rg58
well actualy it is reflected back to the supply seting up strange standing
waves on the line
the meter is at the point or reflecting and therfor will not indicate any odd
swr readings let alone the fact no one would notice 1/4 to 1/3 of the power
coming back becuse a swr of 2 to 1 means that 50% to 75% is coming back
as for antennas the base loaded antennas are junk most of them have a tuned
dummy load at the base with a wet string for a whip
with a 3 foot whip it is allmost 8% efficint well you ant going to notice that
becuse
it will only mean one to two s units with both of you using them when the company
actualy uses a tuned matching unit at the base it might be 25 to 50% efficint but
only on transmit becuse the antenna is still only 8% efficint on receve even less
now becuse on receve it acts like a 400 to 1000 ohm impedance going to a
4 ohm load (ie) the base network is a 50 ohm to 4 ohm setup and in revers
the antenna seas 4 ohm that is a 20 db loss over a 10 db loss for a total of
30db that is half of the 0 to s9 range that is why thay can't hear you but you
can hear them if you have a good antenna like a full 1/4 wave or a
two foot center loaded antenna the two foot antenna is about 25 to 30%
efficint as compared to a half wave dipole with 50ohm fead with no
matching transformer and that is not 25% on tx that is both ways
a quarter wave is about 75% efficent with 50ohm fead

as far as base antennas go a half wave center fead antenna with 75ohm
coax is best with a 1/4 wave ground plane with 50ohm coax and the radials
at a 45 degree angle to breing the fead point to 50 ohms as second best
and next on the line is a jpole antenna fead by 50ohm coax becuse of the
size

a 5/8 th wave and 3/4 have very fragmented lobes most of the antennas
send the signal to space. for people working skip that might be a advantage
becuse the higher the angle the closer the retern bounce that alowes you to
work state side quite well and it still has a ground lobe for the locals and for
long skip (ie) lowe angle of singnal means forther the retern bounce
if i wer you i would stick with the dipole for beter local communication
and if you are one of the people that are determend to work skip
well the dipole is beter for long skip becuse most of the signal is radiated
at lowe angle in the ground lobe
beams have no ground lobe when they are horizontaly polerized but are usefull when verticaly polerized
the power output is of no meaning when compared to 30 40 and 50 db gans and losses
all it will do is splater someone
harmonics and spers are held to 40db and 50 db down for a reason
lets say you are 10 over s9 on 19 with 50db down spers then on 20
you would cover up somone that is s3 and normaly perficly readable
with that 200 watt peak amp with 5 to 10 db down spers on 19 your still only 20 over s9
and on 20 you will cover up somone that is 5 to 10 over s9
pardin my laguige but
WWWWWWWWWAAAAAAAAAAAATTTTTTTTTT   the HELL is wrong with your poor diluted mind that
you can justify a use of a amp

it is ilegal wrong inconsiderit and just plane bad practice and technically dumb

I agree, I enjoy SSB DX with the legal 12 Watts. I have worked many parts of Europe, South America, Australia, New Zealand, etc without an amp. However at times I think 200W would be a nice help. With the current sunspot cycle you don't need any more than that.

At times I consider getting a ticket but I am currently way too busy. It would be nice if the FCC would change the rules to allow 11 Meter DX, since it just naturally happens with legal set ups.

However, I don't get too excited about the FCC with my clean 12 Watts. Especially with all of the 500+Watt stations, that over modulate and splatter the whole band. When those guys start getting busted I will reconsider.

Using a  transverter is not the same as a 2510 modded for 2 meters.

I've been advised by most... that the Power Mike is just a toy that makes my
broadscast sound "unclean".
By using the dynamike adjustment on the unit, I should have no problem with
my modulation.

I'm bagging this idea.

Thanks for the input.

Robert,

That's one of the best descriptions of packet I've seen. The only thing you left out was a discussion of nodes and packet on VHF vs HF.

Regards,

Arnie -
KT4ST

Robert Walling wrote in message <37E94730.14590F3B@wcom.com>...

Packet radio is just a way for two people on computers to communicate with each other using radio to get the data from one computer to the other computer. Most people who use the internet use a "dial-up" connection to pass data. Instead of using a modem and phone lines, packet radio uses a "TNC" instead of a modem, and radio instead of phone lines. One computer user types in something like "Hi, this is Bob in Texas", and the infomation is sent into that person's TNC, where it is converted into a "packet". A packet of information contains the text that is being sent, along with the originating station's callsign, the destination station's callsign, and a CRC which is used for error checking. The TNC waits until the frequency is clear, keys up the radio, then transmits the packet in a burst, then returns the radio to receive. The other station receives the packet burst, and his TNC decodes the packet. The CRC is checked to be sure the packet was received correctly, and if the packet is addressed to him, then the contents of the message is displayed on his computer screen. "Hi, this is Bob in Texas". A TNC and modem are similar, but a TNC can only receive or transmit separately, not tx and rx at the same time like a modem. And the TNC uses error checking. Packet radio and phone patches don't have anything to do with each other.

Richard,

I've been out of CB for a while, but I had a Cobra 50 watt mike back then
and seemed to work well.  The guys/gals still on CB would probably have a
better idea of what's out there now, though.

Regards,  (73)

I've seen articles on how to convert the Cybernet CBs to 10 meters and even 6 meters. But 2 meters would be way too much of a stretch. For one thing, the RF devices would have to be replaced with "VHF" parts. The L/C network combinations would have to all be redesigned. And of course there's that little problem of adding an FM discriminator. VCO injection would take care of the FM TX although it would change in deviation and linearity as you increased in frequency and the VCO voltage changed. Varactor modulation of a fixed mixer crystal would be more stable, but would be more complicated

Sure, it's not impossible, but is it really WORTH it?

Of course, if what you REALLY did, was build a transverter, and use the
CB as an exiter, that's really not the same thing.

Agreed. That's the same as stating that my boat will do 80 MPH. While
being towed on the trailer. The 2510 is not working on 2 meters.

Transverters DO open up interesting possibilities for HF radios. But
don't portray it as a "mod" to the radio. It implies something more than
it really is.

A couple of days ago I posted a request for anyone who knows something about the sweet sixteen, texas star, to make some comments regarding a comparison between it and the Messenger with 8 2879's.   So far no answer.   Maybe my thread got burried too fast, so here goes again......
Pllllllllleeeeeease...   I will drive it with a 2950 or sometimes with a 2510.   I am mostly interested in reliability and a good clean signal on SSB.   I have dual batteries and a 175 amp alternator in the pickup truck.
I have always been willing to spend the necessary money to get something good but want to do this right the first time.   I currently have the TS 500v which works good, I just want to step up a little.   Thanks again in advance..

I have a Texas Ranger 696F ssb base for sale. It has been modified with extras. This rig has a six digit freq counter, talkback, a 5 tone doorbell added , and an open clarifier. I have all reciepts for this radio. I bought it new 5 months ago and hardly used it. This rig has maybe 10 hours of talktime on it. I am asking 300 dollars with shipping costs included. I spent 350 just for the radio from Copper Electronics. Thank you all for looking at this ad. Email me with interests or questions.

Let's set the illegal operator debates aside for a moment and start a new thread. This one is dedicated to all the stupid, foolish, misleading, and downright incorrect statements sellers make during online auctions. All meant in good humor, of course!

The first entry comes from Yahoo! Auctions site:
http://auctions.yahoo.com/auction/8946230. This gentleman is selling a 2-meter mobile rig. In the description, he offers the following notice:

"When you bid on the rig, please e-mail me w/ your callsign so that I can verify you are a ham. It is illegal to sell a ham radio to someone who is not licensed. "

Nope. Guess again. Better go back to your Gordon West books.

Note: this address does not accept unsolicited e-mail. Please contain all discussion regarding USENET posts to the appropriate newsgroup thread.

I've just finished updating my website at
http://www.buffnet.net/~kny2vs/welcome.html

The main page above has been updated slightly. The News Page has been updated and some slight changes made to the amateur radio and HF Monitoring pages.

I've also added a "KNY2VS Reviews..." page where I will present reviews of various radio equipment. For the time being, there is only a review of the MFJ-1020B Active Antenna there, but I will add more reviews as I write them.

The Amateur Radio page in particular will be the subject of another, much more extensive update in the near future as I continue working on my modest contribution to the world wide wait...er, web. :-)

73 and good listening,

They are playing games with numbers. If this number represents anything then it goes something like this:

12 dbi = (3.85 dbd antenna) + (2.14 db, for the dbi to dbd conversion) + (6db for a theoretical maximum ground reflection)

6+2.15 +3.85 = 12db

Your points here and in the previous post are valid, but they don't address the issue: real world performance. My point was that wattage increases that are far less than what's required to produce a 3 dB or 6 dB increase very often produce useful performance improvements. The old rule of having to produce a 3, 6 or 10 dB improvement (whichever suited the author's fancy) otherwise the proposed change isn't worth the effort is a myth. You can use physics and mathmatics to support a counterpoint, but again, you'll be using oranges in a debate about apples. If you have any practical experience operating a CB station, you know I'm right.

It's simple; voltmeter-based wattmeters don't agree with classic equations. My explanation is based on practical experience with certain pieces of test equipment rather than physics and mathmatics. That's why twice I qualified my statements with "using a Bird." Rather than say it all again here, if you'd like a lesson in practical power measurement, read the AM Tutorial on my website. There's a link to it below.

You and Jack are where I was a couple of years ago. You think CBers don't know what they're talking about because

their answers and explanations don't agree with the
simple equations that have been tattooed on your brains.
I used to think just like you. I know better now. There
have been some very sharp, pragmatic people that have
come and gone since I've been participating in the news-
group. They spent alot of their free time setting people
like us straight. Unfortunately, these never-ending,
petty, repetative debates grew weary and caused them to
stop participating. The flow of high-minded yet ignorant
people to this newsgroup is never-ending--it suffocates
those who are trully wise in matters of practical radio.

The 2510 has to be "modified"
to work with the transverter!
I suggest you look the word up
in a dictionary! Providing the
required signals for mixing to
produce the frequencies required
for 2 meter operation involves
quite a bit of "modification"!

Jack

Dave wrote: (responses in brackets are mine)

But 2 meters would be way too much of a stretch. For one thing, the RF devices would have to be replaced with "VHF" parts. The L/C network combinations would have to all be redesigned. (all of this is provided by the transverter) And of course there's that little problem of adding an FM discriminator. VCO injection would take care of the FM TX although it would change in deviation and linearity as you increased in frequency and the VCO voltage changed.
Varactor modulation of a fixed mixer crystal would be more stable, but would be more complicated. (all of this already exists in the 2510)

Sure, it's not impossible, but is it really WORTH it?

Of course, if what you REALLY did, was build a transverter, and use the CB as an exiter, that's really not the same thing.

The "CB" as you put it does not play the role of "exciter" as much as it plays the role of main oscillator and mixer in the case of the transverter. The term exciter is applicable to the extent that the tank circuit for the 2 meter transmitter is wholly contained in the transverter itself, lending to the use of this terminology in this particuliar case. The transverter simply provides the necessary mixing signals to facilitate operation in the 2 meter band. And no, using a transverter is not the same as completely tearing down the 2510 and converting it to 2 meter operation. The major advantage of using a transverter is that the 2510 still remains usable on 10, 11 and 12 meters (or whatever) as well! Also, if you remember, the 2510 already has all of the necessary FM components required such as the discriminator, vco injection for FM TX, etc. . There is no need to duplicate any of these circuits in the transverter itself!

Spend less and have more or spend more and have less.......
I'll opt for the former every time!

Dave,

  Let me use your own analogy!

  Dave wrote:

Agreed. That's the same as stating that my boat will do 80 MPH. While
being towed on the trailer. The 2510 is not working on 2 meters.

  Travelling in the boat on water at 80 mph is much more fun
than travelling in the vehicle towing the boat at 80 mph!

  Wouldn't it also be more fun to spend less time, work and
money to have a rig which operated on the 10, 11, 12, and
2 meter bands than to have a rig that now only operates on
the 2 meter band only?    Just some common sense!  No, the
2510 is not working on 2 meters unless it operates in
conjunction with the transverter, but....It still operates
on all the other bands as well........The choice is yours!

Ok, I am fairly new to C.B. radio, but I have a mobil set up, I got a francis amazer, or as the local radio shop called it, a 102 whip, First why is a 96" whip called a 102", second of all just about all the books I have read say a 9 foot antenna is needed for a 1/4 wave antenna, this would make sence because the formula for homebrewing an antenna (the 234 divided by freq) works out to 9 feet. why not just sell 9 foot whips?? Also I tried it with a 3" spring and got a higher swr than without it. This is buggin the helloutuvme!

You're teasing people here. You're giving them ideas when what they want is a recipe. If you're going to spill the beans, do it right.

I've stood on the side and watched this pile of dog shit get larger and larger. It's quite evident that Robert Schroeder, CB-KING, or whatever his name is; is a agitator. Maybe not at first, but he is one now. At first I think he had such a hard on for CB it became a obsession for him. Nobody on the group would take him in(so to speak) so he took to agitating.

This happens quite often with new guys in my area. They try to get involved with our CB club; but they cuss on the air, key over other members, broadcast music, don't ask for breakes ect... When we quit talking to them they start agitating. The exact same thing happend with this posting thread.

It is a good radio.

> I would like to see one.

You will eventually.

> Maybe when I am in
> Oakland next weekend, I will stop by and look at it.
>
> You near a BART station?

Nope. BART stops in the East bay; I'm in the West Bay.

> I am going to be on the Ankle Express, but if you
> are near a BART, I will stop by...

I wouldn't mind meeting you, but I don't know anything
about BART. Personally, I don't own a 79-290 either.
I'm still using my 2950 and backup President Jackson.
We'd have to go to a shop to see the 79-290.

> Anyway... I do like the 8719 chassis. I can see 10 watts Bird out of one
> fairly easily, and rarely see that out of a Galaxy, even when really pumped.

I never look for average wattage figures. Galaxies
always beat Grants/148s when it comes to peak power

on my bench. However, I've never seen 10 average watts out of any single-final radio--even the AM-only units.

> The ones that mod a Galaxy for that many watts usually see a lot of them
> brought back in a month or so. I also like the TX audio that comes from
> one.

I agree there. The TX audio from a Grant/148 looks alot like the audio from a 76/29; it sounds louder and punchier than a 2950 or a dual final Galaxy. However, I've never compared it to a 79-290. What I've focused on is how nice the 79-290 is on SSB. I take it for granted that the 79-290 will sound at least as good as a 2950 since its a high-level AM modulated radio. That's good enough for me.

> The transformer modulated radios where not in the equation because I was
> talking SSB only. For AM use, any radio that uses a transformer for the
> modulator works well.

I agree; I just wanted to cover all bases.

> >
> > > I typically see more Bird watts from a Cobra 148 than I do a Galaxy, but

> Not necessarily! You ever look at the dual final Cybernet chassis? They
> won't even hit 4 Bird watts! Shitty regulator design.

Like I said, I look for peak power. Galaxies and Superstars (Cybernet copies) always beat Grants/148s in peak power. If they do that with a reasonable waveform, it's guaranteed that the average power will be at least comperable.

One of our discrepancies here is that I don't see the Bird as being the last word in performance. In the field or on the battleground you don't have much choice. There, the Bird in CW mode is the last word other than actual competition. On a good test bench that isn't the case. Like Dennis, I find that average (aka Bird) wattages can be skewed by alot of factors. When a wattmeter is all you've got, I recommend going with maximum peak wattage rather than average wattage as a measure of which is the more powerful unit.

> Galaxy is better, but I never see the even power application from the
> modulator section from the 148.... Due in a large part to the better
> voltage regulation of the Galaxy regulator / modulator. However, when a
> "swing mod" is done to the Galaxy radio, it sounds like shit. Not so with
> the 148.

We'd have to talk about this via e-mail as it doesn't
make sense to me. It sounds like you're trying to
baffle me with bullshit. The modulator stages are
of the same design in the Galaxies as in the 148s.
The only difference is that the active parts of the
Galaxies have to deal with twice as much power so
they're heavier.

> The 148/Grant chassis is
> > one of the weakest TX performers still in production,

> > they used such low-power RF driver and final transistors.
> >
>
> Guess we see things different. Both mentally, and on the meter. ;-0

I don't know what you mean by "mentally." Sounds
like more baffle with bullshit antics. The 8719
chassis has a good sound but weak numbers--it's
that simple. Anything else is bullshit--and you
know it. 18 peak watts is typical from a tuned-up
148. Any model Galaxy that was that weak wouldn't
stay in production for more than a couple of years.

Depends on the user. Overall, yes... For a moronic user, no. My grandfather owns a 2900 RCI, and although it is a great radio, he much prefers the ease of use of the Galaxy radios.... Can't stand to use the VFO. This may be a moot point, since the 2950 has a "CB" mode, but still is confusing to some operators.

It is a case by case basis, but on the upper end, you would be right.

> > Bill, I don't do this everyday. This is a new chassis to me, although I
> > have heard that the RX section sucks.
>
> I don't agree--especially when compared to the 2950.

Like I said.. I have yet to see the Midland...

The RCI was pretty easy to outdo in the RX section, though. Galaxy chassis
seem to be a little better tuned, but a "Channel Guard" type filter, or
another XTAL filter in line does help them, too.

 But, if I had to buy a new
> > > "standard" CB right now, I'd buy a Midland 79-290.
> >

I have to take your word for it.

>
> > I would like to see one.
>
> You will eventually.

Maybe. I don't do this for a living, and I don't see much that isn't
dealing with competitions, so if the radio won't work well in a comp mobile,
I don't see it. I deal with either tube or strictly amateur equip. on the
base side....

I would be interested to see what the computer section of the radio did with
a linear of some power behind it. That is what I base the computer
controlled radios against... Because that is what is the biggest affect
that my operating standards have.. The Microprocessors have a hard time
with high RF field strength.

Too bad. Although if I get the position out their, I will be living in the
area! Guess that would make a meeting a little more accessible.

For an AM chassis, that is all I look at. For SSB, it is completely
useless. That is what the 4314 Bird is for.... Or the 43 with a PEP kit.

  Galaxies
> always beat Grants/148s when it comes to peak power
> on my bench.

Mine, too. Typically a Galaxy stock will outtalk a 148 on SSB even when the
148 is peaked. They don't like to do more than 18 - 20 watts PEP, whereas
the Galaxy will outdo that stock.

Hats off to Galaxy for a good SSB transmitter.

  However, I've never seen 10 average
> watts out of any single-final radio--even the AM-only
> units.

I can see 8 out of most any of the 8719 chassis. The Cobra 140 / Washington
was the easier TX section to get bigger numbers. The double conversion RX
chassis where a little tougher. I never digged deep enough to find out why,
but that was my findings.

>

And on AM, that punch is usually what gets you heard. You forget, I operate
AM usually.... SSB is a sideline hobby.

  However, I've never
> compared it to a 79-290. What I've focused on is how nice
> the 79-290 is on SSB. I take it for granted that the 79-290

Then we really are looking at this from the same perspective... I look at the AM transmitter. On SSB the Galaxy is a better choice, if you are mainly an SSB operator. If most of my talking was basic AM, I would opt for the Grant / 148 chassis, and I have. The 88 is sitting in a box behind me, and the 148 is in my Suburban!

>

> > > final radios--that means they naturally make
> > > more power than the single-final standard CBs.

Sean and Dennis went through this about a year ago. The higher AVG figures usually do tend to carry the AM signal farther, but the higher PEP figures do tend to make the SSB travel farther (as it should).

Granted, I can see 8 or 9 watts of carrier out of a Galaxy, but the needle won't move when modulated, or you see a slight flicker backwards. What would you rather see..... 9 watts, swinging to 6, or 3 watts swinging to 8?

> >
> > Not necessarily! You ever look at the dual final Cybernet chassis?
They
> > won't even hit 4 Bird watts! Shitty regulator design.
>
> Like I said, I look for peak power.

Their is our difference. I use the Bird, and although PEP on the Bird is available, I don't always use it. It is nice to be able to see the total picture, but if you are swinging backwards, and another station is going forwards, the forward swinging station will be heard, all other things being equal! The negative going power in the backward swinging radio will not carry quite as far as one that swings forward.

Galaxies and
> Superstars (Cybernet copies) always beat Grants/148s
> in peak power.

Cybernet sucks all the way around.

Sorry, but that is my opinion as one that owned a shop. Cybernet had the highest failure rate of any chassis at the time (now I would say that Maxon carries that honor). Because of that, I stay with tried and true designs.

After all, what has worked for 20+ years must have something right!

If they do that with a reasonable
> waveform, it's guaranteed that the average power
> will be at least comperable.

Not necessarily!

I know that the 4CX250 tube will do 12Kw PEP, rated power. Pulsed.

The AVG output power is only 300 watts at that level.

My Pride DX-300 does 900 watts PEP.

It does the same 300 watts RMS.

Big difference, and the same holds true for the radio chassis. Although the
Galaxy doesn't use pulse power, it does not have the AM punch that the AM
only and 8719 chassis do!

>
> One of our discrepancies here is that I don't see
> the Bird as being the last word in performance.

I do, because that is the only people that I cater to. They don't care what
another "standard" says, as long as I can quote them a Bird reading, they
are happy!

> In the field or on the battleground you don't
> have much choice. There, the Bird in CW
> mode is the last word other than actual competition.

And usually, the Bird will tell you the same thing that the competition
will, all other things being equal!

> On a good test bench that isn't the case.

Your right. On a bench, with a peak reading meter, the Galaxy will blow
most any other chassis out of the water. I agree on that. However, I don't
do the majority of my broadcasting into my dummy load....

Like
> Dennis, I find that average (aka Bird) wattages
> can be skewed by alot of factors.

As can any other wattmeter on the market!

When a wattmeter
> is all you've got, I recommend going with maximum
> peak wattage rather than average wattage as a measure
> of which is the more powerful unit.

Actual competition will tell you different! That is where you and I differ.

I deal with competition on (almost) a daily basis.... That is what I purchase my radio for...

That, and to give local information to any trucker that needs it! ;-0

>
> > Galaxy is better, but I never see the even power application from the

And gain figures on the modulator transistor is different, the biasing is different. I will say that for the average radio, the Galaxy has a better modulator. Set your carrier, and that is the number you see on the Bird. It has a lot tighter regulator (modulator) section.

Doesn't change the fact that you can take a 148 down to a half watt carrier, and let it swing wildly from their, and it is completely understandable.

Do that with a Galaxy! Makes the chassis damn near non-understandable! I know. I have to set these radios up for competition use, and I don't run GARGANTUAN carriers!

> >
> > Guess we see things different. Both mentally, and on the meter. ;-0
>
> I don't know what you mean by "mentally."

What do I mean... I mean that I like seeing higher avg power, you like higher PEP. I like the old chassis, you like the new.

Nothing wrong with either of us, because we use our radios for different purposes. For your applications, I agree, the Galaxy (RCI) chassis is better.

For the AM use, and occasional SSB, the 148 chassis is a better radio. It is time proven, works well at any carrier level, sounds good at any carrier level and lasts even after it has been abused all day long.

You can't say the same thing about a Galaxy!

On SSB, though, the Galaxy will eat a 148 for lunch!

Sounds
> like more baffle with bullshit antics.

No, not at all.

The 8719
> chassis has a good sound but weak numbers--it's
> that simple.

That is what an amplifier is built for. Numbers. If you have garbage going in, garbage goes out.

Anything else is bullshit--and you
> know it. 18 peak watts is typical from a tuned-up
> 148.

Yes, but the avg numbers are a lot higher than an equivelant "other brand".

Any model Galaxy that was that weak wouldn't
> stay in production for more than a couple of years.

Your right again! But, those are radios that have a purpose. Just like the 148s.

You can get an equivelant 148 radio with a Galaxy faceplate for nearly the same price... No freq counter, etc.... If the 148 was such an outdated piece of shit, wouldn't word be out by now about it? I mean... Why do they still make it?
>
Later.

That's not necessarily out of the ordinary. When you turn an amp on the radio sees the input of the amp rather than the antenna. Not all amps have flat input circuits. In other words, not all amps present a perfect impedance to the radio.

> I
> tried a longer jumper,9 feet(original was 3) and didn't change much. Can
> anyone tell me what is going on?

See above. You shouldn't expect the amplifier's input circuit to be a perfect, non-reactive, 50 ohm load because that's rarely the case. What's going on is that the amp is presenting something other than a purely resistive 50 ohm load to the radio.

> By the way, I think it is an older model and shows 15-80 meters on the
> front.

Personally, I wouldn't worry about it. The rule is still the same: don't worry about SWR unless it's above 3:1. The only way to correct it is to rework the amp's input circuit. Most people, including CB shop techs, are not able or qualified to do that. You might try switching amongst the different output power positions to see if one presents a much better match (lower SWR) to the radio than the others. That, very often, does occur. One notch down from wide open (maximum) is usually a good overall setting.

Another worthwhile test is to test the SWR between the amp and the antenna. Problems there can often translate into problems on the input side.

Their was a Lead Field Officer in the San Diego office named "Mike".

His handle was Three Legged Snail.

I sold him his first radio.... A Midland Precision Series SSB for a hundred bucks.

I also sold him his first 10Kw amplifier.... A 4 tube 4-1000Z amp.

Nice guy.

He just retired from the "Commission" and talks skip on 6, albeit with a new handle.

The Francis antenna has a copper wire down the middle, the whip is made of stainless steel. Copper conducts better than stainless, therefor the resonant frequency length is achieved with a shorter piece of copper than it does out of stainless steel, it other words copper has less resistance than stainless, therefor it moves electricity faster than stainless, if the antenna was made out of gold or platinum it would be even shorter.

Dat 10 ohm smoke,
Sure make you choke,
Da more dat smoke,
Da more ya broke,
Damn dat 10 ohm smoke!!!!

> confusing to some operators.

A "moronic" point is exactly what it is. The 2950 in the CB
mode is EASIER to run than a CB because it outlines the RC ("A")
channels. In other posts I've said that the 2950 can be intimidating, but that's only until the owner reads the owners
manual or has a helpful dealer go through it with him.

> It is a case by case basis, but on the upper end, you would be right.

Okay.

> another XTAL filter in line does help them, too.

The thing to remember is that the 2950 is still as sensitive as any other--it's just not as selective (quiet). In other words, it's not like you're going to hear things on other radios that you won't hear on a 2950. The difference is that there's more hiss noise in with the signal when received on a 2950.

I use a 2950 as my base/bench radio. Not long ago I got tired of hearing the bullshit and conducted my own test to see just how bad the 2950 receiver was. I had a 138XLR on my bench. Many on this newgroup think that chassis has one of the best receivers ever made. Personally, I don't agree. The UPd 858 chassis that includes the 139 is a single conversion receiver with a fancy filter. I've done all the common receiver mods to my 2950. Both the 139 and my 2950 were in peak tune. The 139 was quieter, but there were weak signals that I just plain couldn't hear (I couldn't make out the words the person was saying) on the 139 that I could (I could hear the words) on my 2950. I don't like how noisy the 2950 receiver is. They could've used some FETs and quieted it down; but, in my opinion, it's no less sensitive than the coveted late 858 chassis.

Then take some time to go play with one.
It's not a perfect radio in every way, but
it's a great radio for the money. It's like
taking the PC-122 to the next level.

> I would be interested to see what the computer section of the radio did with

I only have experience with them up to the 500
watt PEP level. At that level the radio doesn't
even know anything unusual is going on.

Across the bay is only 20 road miles. If you're
really there I'll show up. On the other hand,
the same goes for you. Once you get a car, come
see me. Seeing my shop may be of more value to
you than seeing my face.

I'd put up a dual final radio against a 148 and win
every time in a competition even though I didn't
sound as loud.

> the 148 is in my Suburban!

Given what you've said, we aren't looking at this from
the same perspective. In my view it takes an AM-only
standard to beat a dual-final in competition. In other
words, my 2950 won't sound as punchy but it'll beat
your 148 every time.

I don't know what that means. Real dual final radios show higher
average AND peak numbers. I never heard Sean or Dennis say a 148
carried higher AM average wattages than a dual final radio. For
me to believe that you'll have to pull up a quote. My personal
experience says no to that--what else can I go with? I remember
Sean saying his personal mobile radio was a 2950--not a 148--even
though he could have anything he wanted. Logic tells me that if
a 148 was better than a 2950 that's what Sean would be using.

> Granted, I can see 8 or 9 watts of carrier out of a Galaxy, but the needle
> won't move when modulated, or you see a slight flicker backwards. What
> would you rather see..... 9 watts, swinging to 6, or 3 watts swinging to 8?

Given your conditions, there's very little difference.
Both will hold steady at 6. Like you've seen, my 2950
will hold an 8 watt carrier on a Bird. On a 148 the
needle would swing back to 6 and a half. I'm not a dummy.
I've been at this for 20 years. I know what 148s and 2950s
do. A perfectly well-tuned 2950 won't backswing even when
forced to hold a 10 watt dead-key assuming it's DC supply
is adequate. NO 148 could ever hold a 10 watt dead-key
without backswinging on a Bird.

> > >

> forwards, the forward swinging station will be heard, all other things being
> equal!

How do you ever know when that's happening? And who's to say that's really the truth? I can just as easily say that the station with higher peak power is the one being heard. Today, modulator kits are everywhere. They skew the classic, average Bird assumtion. Dennis tried to teach us that long ago. I accepted it--you obviously haven't. Peak power readings are the only truth left to us--get used to it.

> Galaxies and
> > Superstars (Cybernet copies) always beat Grants/148s
> > in peak power.
>
> Cybernet sucks all the way around.

That's a biased, personal opinion based on nothing of substance.

> Sorry, but that is my opinion as one that owned a shop.

Again, so what?

> Cybernet had the
> highest failure rate of any chassis at the time (now I would say that Maxon
> carries that honor).

Not in the old days. Only when the copies became prevalent. Think about it. Midlands, road talkers, and Penney's radios were and are every bit as good as their uniden counterparts.

> Because of that, I stay with tried and true designs.
> After all, what has worked for 20+ years must have something right!

That's bullshit. Uniden survived--that doesn't make their stuff better by proxy. If Cybernet evolved like Uniden evolved, who's to say Cybernet wouldn't be better?

Personally, I think alot of the "export" designs are as much Cybernet copies as they are Uniden copies. Look at the trace paths on the left side of the solder side of the board on all Superstars and Galaxies as well as their new copies like Northstar. The board design looks much more like a Cybernet than a Uniden design. At the very least, somebody is stealing the old Cybernet board layouts. What's to say they aren't stealing the circuit designs as well?

You need to look at this objectively.

> If they do that with a reasonable

> > waveform, it's guaranteed that the average power
> > will be at least comperable.
>
> Not necessarily!

Yes, necessarily.

> I know that the 4CX250 tube will do 12Kw PEP, rated power. Pulsed.

Pulsed power is bullshit when compared to CB.

> The AVG output power is only 300 watts at that level.
>

> only and 8719 chassis do!

That's crap. If that were the case they (Galaxy) wouldn't
be sucessful. The majority of bucks-up CBers use Galaxy
radios because they're known performers.

The first thing you need to straighten out is the output
out of that DX3. It should hold that 300 watt carrier and
then some resulting in a much higher peak value.

> >
> > One of our discrepancies here is that I don't see

What difference does it make? A dummy load makes
other factors become equal. You should like that.
I have to say that sustainable peak rules.

>   Like
> > Dennis, I find that average (aka Bird) wattages
> > can be skewed by alot of factors.
>
> As can any other wattmeter on the market!

You're using a Bird--we KNOW that thing can go
all over the place--at least admit that. Average
Bird readings are even a bigger joke.

>   When a wattmeter

If my 2950 were to beat your 148, what would you say then?
I trully believe that would be the case. If you intend to
live here and talk like a big shot, we'll have to clash.

> >

What makes that "mental?" You're talking meter readings.

I want to get along with you, but you can't bully me. Maybe
you should call me when you get close.

> Nothing wrong with either of us, because we use our radios for different
> purposes. For your applications, I agree, the Galaxy (RCI) chassis is
> better.

It's a little late in the game for that.

> For the AM use, and occasional SSB, the 148 chassis is a better radio. It
> is time proven, works well at any carrier level, sounds good at any carrier
> level and lasts even after it has been abused all day long.

That's simply crap.

> You can't say the same thing about a Galaxy!

Yes I can, and I already have. My 2950 will
support a 10 watt carrier at 14.5 volts.
Show me the nearly stock 148 that will do that.

> On SSB, though, the Galaxy will eat a 148 for lunch!

The 2950/Galaxies will eat 148s in any mode--
that's what they're made to do and that's why
they're popular.

> Sounds
> > like more baffle with bullshit antics.
>
> No, not at all.

I believe you're being genuine, but your arguments don't work.

>   The 8719
> > chassis has a good sound but weak numbers--it's
> > that simple.
>
> That is what an amplifier is built for. Numbers. If you have garbage going
> in, garbage goes out.

That's true to a point, but we're not talking about amps--we're talking about radios.

If you want to talk amps, I really believe in the straight 4-pill design. I believe the straight 4 to be the most popular design in production today because of how the radios work. The straight 4s are a perfect match to the 30-35 watt PEP radios that are very popular today. That doesn't include the weak-ass 148.

>   Anything else is bullshit--and you
> > know it. 18 peak watts is typical from a tuned-up
> > 148.
>
> Yes, but the avg numbers are a lot higher than an equivelant "other brand".

Using a sinusoidal waveform, 18 peak watts means the underlying carrier was no more than 6 watts. That also holds true for average Bird watts.

>   Any model Galaxy that was that weak wouldn't
> > stay in production for more than a couple of years.
>
> Your right again! But, those are radios that have a purpose. Just like the
> 148s.
>
> You can get an equivelant 148 radio with a Galaxy faceplate for nearly the
> same price... No freq counter, etc.... If the 148 was such an outdated
> piece of shit, wouldn't word be out by now about it? I mean... Why do they
> still make it?

The word is out on it. I had one that was fully modified and it took me 6 months to sell it because they're just not as popular as they used to be. It was a sound-tracker too. People know that they're weak compared to today's radios. They just don't want them anymore.

     If you really go nuts (more than 2000 peak watts with a
     decent antenna), people will hear you that you can't hear.
     That represents a badge of honor in a dumb useless way to
     dumb useless people.

     In a basic stupid way, the goal is to be able to talk to
     anyone you can hear.  That usually takes 500 peak watts
     at least.  These are all estimates with no guarantees.
```

> 3. What kind of investment in $$$ would a decent unit run (entry
> level, but decent?

I'm assuming you already have a suitable radio and antenna. If so, you're only looking at the amp. Given that, I would start at the 500 peak watt level. You're talking at least $300 to go to that level. To get it installed and working, you're looking at another $100. So, let's talk $400 to $500 to get something decent going at least. This assumes you've already had little amps like the Blue Face 225 and you want more. If not, the 225 will help and can be made to work for $100 or so.

> power source; connect it to an antenna and you're set to go or is it
> more complicated?

At the 500 peak watt (4-pill) level, that's correct. However, there are some simple system improvements that will net you noticeable increases. Tuning your radio makes a difference that's worth doing.

> 5. Any other things one might need to know?

Yes, but they should be between you and your dealer. In other words, getting personal with your equipment dealer is a good thing. If the dealer you choose is impersonal, you should move on and not look back.

> Thanks a lot,

You're welcome.

> Ray

     The answer should be "yes."   The risk of confiscation
     and fine is so small that you should worry about it as
     much as you worry about slipping in the shower of dying
     while crossing the street.

     Anything you can turn down makes a good driver.
     The 500V isn't a "fantastic" driver because it's
     not unbiased and it can't be set to run at the
     same carrier level as the radio.

Just a theoretical question? Not far from my home is an old radio
tower   (approximately 200 ft) that is no longer used.
If by chance I could install an antenna on top of it with nobody
knowing, run coax down and just have it waiting for me to pull up with
my mud-ducking mobile. Would that increase my ability to transmit?

Newsgroups: rec.radio.cb

Andrew this is "Line of Sight" problem. At 11 meters the formula for determining the line of sight for a radiowave (in miles) is "1.4 x the Square Root of the Height". This is of course is not taking into account ones individual topographic conditions and assumes we all live on a flat, smooth sphere.

An example would be; If you had a house that was 20' high and then added 15' of antenna mast connected to an antenna, the "line of sight" for this radiowave would be 1.4 X the square of 35, which = 8.3 Miles

Using your 200' tower the calculation would be: 1.4 X the square of 200, which = 19.8 miles.

Using the tower is a 240% gain in "Line of Sight", and even your Mud duck mobile will transmit further than you ever beleived it would by using the structure. Just make sure that if you do it, that you purchase the thickest affordable coax you can find because 200' of coax, plus the coax run going over to the radio, is one hell of a run for 5 watts. And, do yourself a favor, make sure the antenna system is grounded if you operate the radio on days of not so nice weather conditions. (PS: Dont climb an old tower unless you rope it off with safety guys every 30' or so up the tower because the welded joints in most old tower are the first thing to let go. Its not worth it)

It is Great to reach out and make that contact on legal power. I have a
President Lincoln and a Texas Star DX400 and a Wilson 5000 and never
turn on the amp and always have the Lincoln turned down to try to get
the contacts. I have the power for those hard times when the Megawatts
stations get in there and have absolutely nothing to say but normally
get smoked but who cares. When i flip the dial and hear bleedover from
three channells over I just keep a turning to get away from the mess.

I just bought a 29 WX NW ST and the radio works great. Have a President Lincoln in the Ford pick up and can't get rid of RFI from the motor but when i hooked up the Cobra there was no noise and no decrease in incoming signal. Maybe the Lincoln is tits up but is brand new. Ford just stinks with there shielding i guess.

Did it ever occur to you that the FCC has already visited these wonderful

functions and even joined in the fun?
Have you ever met an FCC agent before? Ever been to lunch with an FCC agent. Ever even been inside an FCC agants house?

Oh but you would not know about these things would you.....I guess all lawyer wanna-be's (like yurself) just have to see things with their faces planted firmly to someone's butt.

I pitty you Mr. RFEnforcer and all your alias's. You must lead a horribly boring life.
Poor thing.

Have a Nice Day!

This is correct. I am not an agent of the Federal Communications Commission and therefore have no authority to conduct enforcement efforts and levy penalties against offenders. I simply keep my eyes and ears open for signs of illegal activities and pass the information on to the proper authorities (kind of like a "neighborhood watch" for unlawful radio operations.) I can do nothing to impede your efforts nor can I change your behavior.

However, I believe it's just a matter of time before someone who does have enforcement authority takes an interest in your activities. Stick your nose out far enough and someone will bite it off. You have to admit, it's not very wise to openly admit to selling amplifiers to unlicensed individuals on a public newsgroup and then purposely attatch your name and amateur callsign to your postings.

Keep doing it. You'll eventually catch the attention of somebody "important" who can do something about your activities.

Note: this address does not accept unsolicited e-mail. Please contain all discussion regarding USENET posts to the appropriate newsgroup thread.

Cute!

Wanna bet that now we're going to hear about how to synchronize the
frequencies from several FRS radios to make a phased array and get
around that 1/2 Watt limit! :-)

HI,
I am interested in a linear amplifier and have some questions. I'll
just jump into them and hope someone can assist me:
1. How much power increase in transmitting is gained?
2. How much farther can you communicate? (obviously the other party
would also need to be similarly equiped).
3. What kind of investment in $$$  would a decent unit run (entry
level, but decent?
4. Am I correct in assuming that you simply hook the unit to a 12 volt
power source; connect it to an antenna and you're set to go or is it
more complicated?
5. Any other things one might need to know?
Thanks a lot,
Ray

Yes. They are illegal for use on CB. Get caught with one and you could be
subject to a $10,000 fine plus confiscation of your equipment.

Ask yourself the following question: "Is it really worth the risk?"

There was an antenna article in CQ VHF not too long ago that covered this
issue. The author had painted his antenna flat black with no noticable
difference, and stated there was no notable difference up into the ghz range.
I'll try to look it up for you if you are interested.

Does ANYONE make a mounting bracket for multiple radios that will fit over the transmission hump?

What I am envisioning is a metal "rack-type" mounting apparatus where 3 or 4 radios could be "stacked" vertically and mounted in the area between dash and seats. A strong, sturdy mount that would attatch permanently via sheet metal screws to the car floor above the transmission...completely covering the "hump." Something like this would provide a neat, custom installation for all my equipment.

Come to think of it, what do the cops use to mount their multiple radios? Since I drive an early 90s Mercury Grand Marquis (dimensionally equivalent to a Ford Crown Victoria), I'm thinking whatever works for them would work for me as well.

Who sells and/or custom-builds these things?

If you could do something like this you would want to use very good quality
coax or you may lose more than you gain.

Please be advised that using a linear amplifier on CB is illegal and carries substantial penalties if caught. If despite this warning you decide to run one anyway, at least be considerate of others and use a clean amp.. Class "C" amps *DO NOT* fall into this category.

As far as which is better Tube v/s Transistor, it depends on what you are looking for in an amp.. If you're looking for an amp to run mobile, solid state is the only way to go. Comparing "apples to apples" (base amplifiers with built in power supplies): Tube amps are offered at higher outputs and are generally less expensive than solid state amps with an identical output level (high power amplifiers 1kw+, the price difference diminishes as you step down to lower power amplifiers). However, tube amps have to be tuned when you change frequencies, and the tubes will eventually have to be replaced (no tube lasts forever). In particular, stay away from amplifiers that use T.V. sweep tubes. With the exception of the Svetlana EL-509, these tubes are no longer being manufactured and are getting more expensive every year as NOS tubes are depleated. If the amplifier doesn't run tubes designed for RF amplification ie: 811A, 572B, 3-500Z etc. etc. don't buy it!

Solid state amplifiers don't have to be tuned, are generally quieter (those that don't use a blower for cooling), and the output devices will generally last indefinately (as long as all operating parameters are kept within the manufacturer's specified operating tolerances). Heat is the transistor's enemy. If the amplifier is properly equipped with sufficiently sized heatsinks, is properly driven and loaded (no high VSWRs please) you should enjoy years of trouble free use from a solid state amplifier.

Hope this helps.

I own a Cobra 29 with Sound Tracker and Wilson 5000 antenna.  Should I add a
swing kit.  I seem to be getting out fine within 2 to 3 miles.  Cobra says it
will void my warranty.  Has anyone out there had experience with adding more
wattage via swing kits?

Thanks, Mike

I tend to agree. Before you buy a "Sweep Tube" box, check out an 811 box.
The tubes are around $20.00 and can triple the rated output of a 6lf6.

Mike,
If you are only getting out 2-3 miles , either skip is at its heaviest peak
or you need to do something.
Tinker

Jim,

I've got a few hundred odd cut crystals for the older, popular CB's along with a batch of Sam's Photofax manual and am selling out. If you're interested or know someone who might be, please let me know. I've been out of the loop for quite a while earning what I'm worth in another field

Thanks, Charlie Kneisel, PA

The 2950 does PL tones? Since when? I know mine doesn't. All mine has is
a stupid roger beep. It does do splits quite nicely though.

The Uniden HR-2600 DOES do PL tones and repeater splits, which was its
advantage (for a 10 meter FM ham) over the 2510. For the Cber, the 2510
was a better choice.

FWIW, I've never seen a galaxy radio that I really liked. Most of them
sound crappy on SSB, especially after they've been "done up" by Joe
screwdriver. Their frequency drifts, the built-in counter generates hash
noise on some models, and I've seen some that the final stage self
oscillates. Not the kind of radio that I would own......

I still like the 2510 as the 10 meter radio of choice, and the Uniden
8719 chassis for "legal" CB, although that Midland model sounds very
interesting.......

I have no arguement with what you've done, and agree with what you say, and applaude your creativity. My only "bone of contention" is saying that you "modded" a 2510 to work on 2 meters. It's a misleading statement, which implies that you somehow made THE RIG into a 2 meter radio, which is not true. Yes, you might have had to "mod" the rig to work with your transverter, but it's not really the same thing as making the entire radio into a 2 meter radio. It's no different than someone saying that they "modded" their Cobra 29 to put out 500 watts, which oh-by-the-way, is because they added a 500 watt amp after the radio.

Why would you want the driver to be unbiased? Especially if you want to work SSB?

Ok, but there isn't much magic to using a transverter. I've used one for 6 meters for years. The main things that you need to deal with are attenuating power output, down to the level used for mixing within the transverter, T/R switching, and level matching the receive drive.

A properly designed transverter should require NO modification to the "drive" rig, as it uses 10 meters (or whatever) as its "I.F.", and all signal "conditioning" are done within the transverter itself.

Some drawbacks are that there are cases when strong 10 meter signals will "leak" into your radio overtop of the 2 meter downconverted signals. This can be partially compensated for by using a high grade shielded cable, and making sure all connections are "tight". Other problems are that the "quality" of the drive radio is not as good as a well designed 2 meter all-mode. My 2510 is a good radio for what it is, but the FM audio quality (receive and transmit)is not as good as my 2 meter all-mode. The 2510 uses a carrier squelch, which can be annoying on FM, as noise pulses can break the squelch. A simple noise squelch circuit can help in this area, and is one "mod" that I recommend for anyone doing serious FM work with a 2510.

But hey, it's a cheap way to get on 2m SSB! Good luck with the setup!

Why on earth would it cost 100.00 to get just an amp installed? Lets assume you strart from scratch on the amp install. Here is what you will need.

1. 15 ft of four gauge welding cable(the best thing you can use for a 4 pill and up) with battery terminals on each end. 20.00 max
2. 2 wire nuts suitable for 4 guage wire. 1.99 here locally at scottys
3. one 3-6 ft jumper 7.95
this comes to a grand total of around 33.00 with tax if you buy the stuff retail. just about anyone out here can give you detailed instrutions on how to set it up and install the amp yourself. It is a fairly straight forward job and really is pretty easy to do.

And of course, the fact that it is illegal should have no bearing whatsoever, right?

Used to be, people had respect for the law. Now, anything's fair game as long as "I probably won't get caught." Just another example of our rapidly-eroding moral standards and general state of society in America today.

How do you propose to climb a 200-foot tower and install an antenna, undetected? Neighbors and passing police cruisers tend to notice these things.

Newsgroups: rec.radio.cb

I want to thank everyone who responded to my thread. As a result of your input, here is what I am going to do.   I'll get the Texas Star, 1600 with the factory fan kit, mounted behind the back seat of the truck. I will use the 2950 (at least at first) with my TS 500V mounted under it in the drivers compartment. The 500V should be OK as a driver if it is turned down very low. To use the setup, I could 1) transmitt with the radio barefoot.   2) transmitt with the radio and 500V only.   3) transmitt with the radio driving the 1600. 4) transmitt with the radio, 500V and 1600 all on.

Seems to me with these choices, the set up should do just about anything I would want out of a mobile and still sound great.

One of the reasons I was hestitating to use a driver is most of them appear to be Class C and that would detract from SSB quality.   Naturally, as most of you probably do, I use SSB around town, (a large metropolitian area) to shoot skip, and AM while on the road.

The last think I am querious about is if while using the radio into the 1600 without the driver, will the 1600 relays kick on and stay on with just the radio as imput? I guess I'll find out.

Last,   are there any units built specifically as drivers that are Class AB? I would be pretty unhappy if I accidentially had the TS500 turned up high and turned the 1600 on at the same time.

Thanks to everyone again.   You are a big help.

I have a few comments about the WDc Break. It may have been a huge success for the Club, they worked hard on certain details but left many to be desired. Specially where the "real money maker" for the club is in the keydown Contest. Rules were handed out and If I am not mistaken rules were posted on the web for some time before the break. Upon arrival Friday night I was told even before all of the competitors were even there to have there say as well, the decision to not allow the Tall antennas in any of the sky classes was already rendered. Not allowed, I guess the people who said no to this didn't just put out there hard earned cash and time investing in a set of the antennas with the full intention they were to be allowed in the sky classes. The people who said No to this came to the break knowing full well they were to be used at the break in the sky classes. Hmmm maybe they were afraid to lose with there big bad mobiles to a guy with 1/2 the watts. I know of 5 people who came a long way to key in the sky classes but now it was the old bait and switch tell them one thing to get them there when they get here tell them another. Next point of business, the AC 1 Alt Class was to be no more than 3 alternators, this rule has been in effect at WDC's for 2 years and was fully known before the break. After the competitors paid an entry fee, a meeting of sorts was held on the field, the people running more than 3 alternators wanted to get in the class, again this is nothing new to this break always was 3 or less Yet the Club changed the rules completely saying there would be no class if not more than 3 people stayed in to my recollection 2 guys were running 3 alternators and they were basically forced To key, so now it was 4 alternators perhaps even more I didn't see anyone check each other in the AC 1 Alt Class. To make matters a little worse the person who won AC1 also Won AC multi without making any changes to his mobile, kinda makes you think he was running multi alternators from the start. Was he confident, he sure was he threw $1,000 on the ground wanting to bet the guys who only had 3 alternators? Great Job Gang, Now the best is yet to come, No one had any idea where the station was except one competitor, yes that's right the guy who won all the classes he keyed after finding the target, he was allowed to pull his mobile onto the field after the contest had started and find the target, No one else had this opportunity to do this, you may have put a blindfold on and Spin around and point where ever you wanted to. Someone tell me where this was fair. Also this gentleman was running 5 antennas do you think this may have helped him lock onto the target. People were told the Watergate would key up before the contest and a chance to find it for everyone. Nope this did not happen either. Now a lot of people spent there hard earned money to enter what they thought would be a fair key, they came to the break expecting the club to hold up its end by sticking by the rules, what sense are rules if you don't follow them. Now if I had won close to $2,000 like the person who was able to lock onto the station and who was allowed to take full control I may be a happy camper today. Instead I feel like telling everyone dont go to this break next year or in 2 years. They tell you one thing and do another. Everyone wants a fair and equal shot at winning at a keydown. When the playing field is changed from what you were told it would be this is not fair at all, and deserves to be made public. If exceptions are to be made to those who cry the loudest who wants to give clubs there money. I would rather stay home and tell others to do the same, instead of giving a donation.

well the head is shocked, you mean there is a lack of fairness at a keydown. well what do you expect??????? this is sop for this type of activity and has been for years. sounds to me like the fix was in and it was a political thing, but whatever..........you are lucky to be able to leave with your radio equipment still working and intact. blow this meaningless behavior off and just talk on your radio and enjoy it. leave this mundane activity to those who think it is important.,,,,,,,,,,,,...........head out and standing by..................

  A swing kit will not increase your wattage. All a swing kit does is lowers
your carrier down to allow you more forward swing. The only advantage to
this is you will have a good clean signal significant gains in your audio.
You are correct it will indeed void your warranty. Putting a swing kit in a
radio will not hurt you at all but be careful some of them out there are
garbage. Remember to do one thing when you get it installed. You have to go
auuuu auuuuuuuuuu auuuuuuuuudio...

I got the got that same letter.It was sent   from RFWATTS whom ever he may be?This is my responce to RFWATTS.   I would like to respond to the negative publicity that the Shootout and the Watergate City CB-er's are receiving due to a gutless want-to-be technician, that has no balls. He came to debut his new boxes. I think he should change the name to "Soft Touch" because they did not bust a grape. This tech has not been competing in competitions that long, so he is still a little wet behind the ears. My advice to him is to stop crying and get his nose out of his ole technician ass and go to work on his mobile.

As far as the � wave antennas are concerned, stop trying. This is a mobile shootout. What's the difference between letting you run them, than a man with

a 100 ft. crank up tower and a beam on his mobile? TRULY SPEAKING 4 ALL TO
HEAR.............. WDCBREAK ....

Adding a swing kit will do nothing to increase your signal strength. All swing kits do is make the output meter on the transmitter and signal strength meter on the receiver swing wildly with modulation which seems to be a big deal among a lot of cbers.

Thanks for the reply Bill. I have interlaced my responses below.

Bill Eitner wrote:

Roger that. Class C for AM on the 2290 driver would have been a good mod for
this amp.

>
> > I can't see it in the schematic I have

>   2 watts if maximum output is what you're after.

That is what I am using now with the "swing mod" that is documented in the RCI
Bible. I don't see much swing on the power meter with the amp on even though
the
RCI 2950 I am driving it with goes from 2 to 6-7W with modulation. I see 200W
dead key and only a nudge up from there with modulation. I can change the
variable
resistor down to get more swing but the ultimate power out with modulation
doesn't really improve. It is still around 180 to 200W on the meter. I have
put it on my scope and setup the radio and amp and got close to 400 W
(estimated) but the peaks were distorted and I sounded bad. I guess you can't
get blood out of a rock. I probably should have gotten the 550, oh well.

>
> > 3.   What is the best average power drive level fully modulated in AM?
>

I am going to try that next. Just a simple change to the "swing" mod :-)
I'll get it to swing from 2 to 10 and see how I sound.

>

>

>

Well, on the subject of SWR I feel I am getting to be nearly an expert :-) My first 667V had an SWR nearly 2.3:1. As it turned out, it was the first order harmonic that was causing the high SWR. I did everything I could think of first before discovering it was the harmonics. A low pass filter fixed the problem and now I am 1.1:1 on 27,185MHZ using a tri-mount mag mount and a Super Penetrator antenna. But before adding the filter I grounded the frame of the mag mount to the chassis and changed the coax to 95% shielded, 80% velocity factor RG8? coax. Anyway, I read more books on SWR and propagation in general. That was the fun part.

>   Do you understand what I'm saying? The 500 is a 667 without
>   the driver stage. Do you know what a driver stage is?

Oh yeah, I even have a spec sheet on the 2SC2290. I was trying to figure out how best to bias it and drive it.   If I get time over the next few months I may experiment with that AM button and see if I can use it to switch the driver stage to Class C for AM. It should be fairly simple to bias that transistor at cutoff but I first have to reverse engineer the amp to confirm/update the schematic I have. I want to know where I am starting from.

Thanks again, later.

Hello everyone,

We finally got the the pictures of the antenna
party up on line. Check 'em out here:

http://www.geocities.com/Baja/Canyon/4106/351/avantisaturn.html

We're gonna pull my Spectrum down for a few weeks
and put the Saturn up once its refurbished just to
give it a test run.

Have a good one y'all,
Stephanie

Beg to differ.
They will not only increase your audio, they will work much better with a
linear.
There are a couple of sites on the net that discuss this very subject. I'm
sorry I don't have the addresses handy but they're easy enough to find. Make
sure you get good instructions if you do the work yourself. It's not a
super-difficult job, but if you have any doubts, go to a qualified tech and
have it done for you. I suggest arming yourself with whatever inf. you can
before you do either. Bottom line is know what you want before you ask for
it.

Good luck

Well, actually there are 2 towers there. As far as neighbors, you must first understand that I live in a rural area and the nearest neighbor of even highway is a good mile or better. These towers are in an old pasture that backs up to my land
so access would be easy. Even eaiser is that the guy who owns the land used to lease that spot to a radio station years ago and hs has no problems with me being there. I guess the towers are just left overs.

Being a construction worker by trade and accustomed to working at various heights. Climbing and putting up an atenna would not be the problem, paying for the coxial would.

The whole point was I was just curious what would happen transmitting a barefoot mobile from there would accomplish.

Hello Andrew: You bet it would. During the late 60's and 70's the group I ran around with had a 5/8 wavelength ground plane, up against a mountain, mounted on a old mining tower that was still pretty sturdy, and about 50 to 60 feet high. You would drive up this old dirt road a few hundred feet, part next to the tower and BOOM-BA instant get out big time.

The PL-259 connector was used a lot, you could tell of the wear on the outer ring, we weren't the only ones using the mountain mounted Base CB Antenna.

If I was you, I'd have a professional climb it and use new good coax like LMR 400, RG213, or 9913F. Yeah! Use a MaCo V58 or Penetrator 500.

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the road ah ways from the fillin station.

It depends on what they are calling a swing kit.There are many modifications you can do to the Cobra 29 to increase its output..both wattage and modulation....You`ll get a lot of negative feed back from some of these guys and I think its just the name "swing kit" that sets them off..I guess there is someone who mass markets a group of components under that name which do nothing
      But any GOOD tech will make modifications to a radio to increase its out put..Hell I know of 35 different mods for the Cobra 29...Don`t forget to up grade the final
      As for your warranty.that only covers manufacturing and material defects any way...And that covers almost nothing that ever goes wrong with them

I hope I did`nt brain my damage.

I'd like to start by saying I'm a newbie here and don't want to step on anybody's feet. I have been using my dad's old rig in my car, an old Midland 23 channel with a new K40 antenna. The radio works great but fits poorly into my car (a dodge neon with minimum underdash area. I want to upgrade to a sideband radio with 40 channels. I have narrowed my choice down to the Uniden PC122XL. I would like to get the extra features of the Grant for just a little boost in price but the larger radio just will not fit into my car without hacking away a lot of plastic while the PC122XL will fit nicely into the spot formally cradling the ashtray. My question is threefold. Is this radio good enough for a newbie in sideband? Am I really stupid for going for it over the Grant? or are there other radios out there that are both small and feature packed while still being a good buy? Any comments good or bad on these radios would be welcome.

Jim

Bill are you losing it?You are picking a 2950 and a galaxie over a uniden?AM only a 76 will out talk any of those junk radio's and last a hell of alot longer.2950's fall apart and short out in most truck setups.Good for a base unit but not year round in a car or truck.Galaxies sounds good but have alot of RX problems and poor solder joints.SSB go with a Grant xl /148.Sean Told everybody out here a while back the 76 put up the best numbers.Go to a keydown and see what people use for radio's. That will give you an idea of the radio's that give the best peak watts and audio.Hint: not to many 2950's or galaxie's.1200........```!```

First, the people who came and where not allowed to run the tall antennas should have withdrawn and not competed. They have to give you your money back.

The people that entered AC 1 alternator should have taken their money back.

If rules where handed out, and then they are changed, it is your right to say "No, I think that I want my $$$ back, or put the rules back in effect".

The problem here is that th entrants put up with it. If you take the $$$ and run, the club will feel the dent in the pocketbook and learn.

They tried to do this in Memphis, and all the AC Sky competitors said that they would not key.

Since the Sky people are the ones that draw the crowd, and they are the ones that people enjoy watching, they are the ones that when they pull out, they make a difference.

Screwed situation, but that is the way it is.

The PC-122 is a stroker, if you get the correct person to work it over.

It will not channel as easy as the Grant, but can be made to go 40 up and 40 down, with a kit.

It is a good radio, overall, and I think you will be pleased.

It is called the Sky class, right?

That means that it is Sky is the limit, or no rules.

The rest of the classes should be run as mobile contests...

The Sky classes have no rules. That is the way it has always been, and the definition of "Sky is the limit" means anything goes.

I also find it very hard to believe that you would allow someone running 3 alternators to compete in a 1 alternator class without pulling a belt off.

You wouldn't do that in the south! Maybe that is why the boys from DC don't come to the south?

Not trying to knock you, or your club, but this person, even if he makes a soft box, couldn't win if he runs tubes in a DC class, is right.

The Galaxy and Palomar 200 (225) watt amplifiers make great drivers on low
and medium, and fit the Class AB driver category.

> 1. 15 ft of four gauge welding cable(the best thing you can use for a 4
pill
> and up) with battery terminals on each end. 20.00 max

Multiply that times two, so you can also run the ground to the battery or alternator. So, that is $40.00

> 2. 2 wire nuts suitable for 4 guage wire. 1.99 here locally at scottys

Wire nuts cause voltage drop under load. Use a junction block ($10.00 here in Houston), and the 4 connectors you will need for the wire, compression type are generally about 4 dollars a piece... This takes it up to $26.00

> 3. one 3-6 ft jumper 7.95

Agreed. 7.95

> this comes to a grand total of around 33.00 with tax if you buy the stuff

> retail. just about anyone out here can give you detailed instrutions on how to
> set it up and install the amp yourself. It is a fairly straight forward job
> and really is pretty easy to do.

Looks like if you do the math, and do a proper install instead of using "wire nuts", you are looking more like 60 dollars in parts (rounded off). Drop another 35.00 in labor (not everyone wants to run the cables themselves), and you are....

Hey, right at the hundred dollar level!

Guess what.

Bill was right.

Your wrong.

He was describing a commercial installation.

You where describing a half assed homebrew install.

They would probably both work, and they <<might>> both work well...

But, why take the chance on an amplifier that will cost someone another hundred dollars to fix <<if>> it goes bad. Have it installed by the shop, and if it is bad from an installation point, you are covered.

Another thing you didn't include in the equation was the grommets to go in the firewall, those would run another 3 dollars, and the fuse block to put in the positive lead, that is another 10 to 30.00, depending on what you use, and the fuse for a 500 watt amplifier would vary from a couple dollars to 10 dollars, once again, depending on the fuse block installed.

I am looking for any other mod's on these radios. On the two Cobra's there is the same PLL, the LC7185-8750... There is no mod for that chip, but I am wondering if I could swap that one out with a different one?

On the HandHeld I am mainly looking for channel mod's...

The Euro, I have some-what peaked it, tho I am suppose to get 15 watts am, and I am only getting about 8 watts.

I am looking for power mod's and channel mod's.

Any help would be greatly appreciated...

Thanks,

BlackCat

Hello "R.J.": More that likely the paint will not effect the antennas performance. But you didn't tell us what type antenna it is, base or mobile, or model or make.

All the bad news from painting antennas comes from painting a fiberglass antenna with a also solid metal type paint. This will effect the antennas performance. However paints that are made for being a paint on metal type material are very expensive. Most other paints well work. A lot of horror stories come from military maintenance personnel painting a fiberglass radome with a heavy metal based paint, many times, causing the antennas performance to be degraded. You will see a lot microwave or radar frequency type antennas that have the antenna surface already painted, with a warning saying "DO NOT PAINT THIS SURFACE"

But CB frequencies are a million miles away from the microwave or radar frequencies, so there will be some forgiveness should a metal based paint be used on a CB antenna.

You can experiment around by using PVC pipe as a over the antenna as a radome. Get a S-meter reading from a station a few miles away, then put the PVC pipe over the antenna, and measure any loss in field strength from another station a few miles away. Then paint the PVC pipe and again get a field strength, or S-meter reading from the same station a few miles away.
I'll bet you won't see any difference.

Then you should take a picture, and let us see what it looks like.

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the

road ah ways from the fillin station.

What a stupid fuck.

Why not try to register the domain first....

Oh wait... They charge before you can register now...

Guess that's why.

Your check doesn't come in until the first!

Yes, I am putting down the name.

Guess you don't do much business with them...

Can't spell... Can't spell their names.....

Funny... How would you own half a company that is divided soley among family members?

You don't even fall into the same class as Dan, and he is about as close as they come to the Henry family.

Nice try, asshole, but I think that you better go attempt to scare someone who doesn't know what they are talking about.

1953 Johnson Viking.

Their is no better AM transmitter that has been on the market.  Ever.

The second.....  1954 Heathkit DX-100.  It is a two tube version of the
above, mounted to a solid copper chassis.

From their, you see CB radios.

On SSB you wouldn't.

Most of the discussions in this area of late assume AM as the mode of operation. On AM, it's popular to set-up at least one driver stage to run unbiased so it can act as a modulator (increase the energy contained in the sidebands to a greater degree than the energy contained in the carrier).

You need to qualify that a little more.

What type of talking do you do, where do you like to talk (frequencies), what type of antenna do you want (perm mount, skip talking, local talking, etc.)

When it comes to covering all of the 10 meter
band and having CPU generated features--yes
I prefer the 2950. For over 10 years it's
been the best value in CB/10 meter radios.

> AM
> only a 76 will out talk any of those junk radio's and last a hell of alot
> longer.

You didn't read the whole post. AM isn't all there is to CB/10 meters. The 76 is a simple radio with an audio output transformer instead of a transistor based modulator--those are the reasons for it ruggedness and performance. On the other hand, it's a simpleton's radio that quickly becomes boring if you're into anything other than competition or banging heads with the AM idiots.

> 2950's fall apart and short out in most truck setups.

There's a million of them in service. Less than 1 percent have problems, but closed-minded people only remember the bad stories they've heard.

> Good for a base
> unit but not year round in a car or truck.

See above.

> Galaxies sounds good but have alot of
> RX problems and poor solder joints.SSB go with a Grant xl /148.Sean Told
> everybody out here a while back the 76 put up the best numbers.

Sean runs a 2950 in his car. Only in competition do you need the "best numbers." And look at Sean; he doesn't even have time to get out here anymore because he's busting his ass honoring the unrealistic warranty he put on all the radios he tuned up in the past. He's far from being all-knowing.

> Go to a keydown
> and see what people use for radio's. That will give you an idea of the radio's
> that give the best peak watts and audio.Hint: not to many 2950's or
> galaxie's.1200........```!```

AM and competition isn't all there is to CB.
You're narrow minded.

Enjoy your 76 since you're so anal that you'll never be able to enjoy anything else.

Exactly. Many of the laws today weren't made by the
people. Of course you wanna-be cop types can't see
past the simple definitions of legal and illegal to
see that many "crimes" are victimless and that the
related laws are just plain stupid.

> Used to be, people had respect for the law.

Used to be, laws made sense.

I can make pointless generalizations too.

> Now, anything's fair game as long
> as "I probably won't get caught."

That's the way it's always been. The difference
these days is that nearly everything has a law

```
     attached to it, and that there's an ever-growing
     group of goofballs like you that have nothing
     better to do than point fingers.

> Just another example of our rapidly-eroding
> moral standards and general state of society in America today.

     Yea, right--get a life.

I like my double coil Crow...

It kicks ass in skip.

For local talking, the Black Al Capone is my choice, although I have a new antenna to test out. Waiting until Lubbock so I can get another Tullos Quick Disconnect to be able to swap antennas fairly quickly.

Absolutely not.

A swing kit doesn't get you anything that simple tuning
mods won't get you except a lighter wallet.

> I seem to be getting out fine within 2 to 3 miles. Cobra says it
> will void my warranty. Has anyone out there had experience with adding more
> wattage via swing kits?

Swing kits don't get you any wattage that a simple tune-up
wouldn't get you.

A simple tune-up will make that radio work as well
if not better than it would with a swing kit. If
you're mechanically inclined at all, you can do the
tune-up yourself. It involves removing 2 parts--that's
it. Here it is: Remove D11 and the slug from L14.
It's no big deal.

A tune-up makes you sound louder, but it really doesn't
give you alot more range. Adding an amplifier is a
better solution if alot more range is what you're after.
A more efficient antenna would help too.

Toll,
What is a Tullos Quick Disconnect? I thought quick disconnects were common
items--why wait till Lubbock. Is there something special about them?? (I
also am looking for a quick disconnect.)

Dale.

     It's only the way it is in your mind.

     I've owned six 2950s since I learned of them in '88.
     I've only had to repair 1 of them.  The others
     were sold to people that liked my sound.  I still
     use one and back it up with a President Jackson
     just in case all the horrible and frequent failures
     begin.  That hasn't happened yet.

> I live in the northeast and the 2950's don't stay together up
> here.Between the cold winters and bumps in the roads the  2950 goes south real
> quick.

     Maybe you've just been unlucky or you're going by
     other people's horror stories.  The main board
     design in a 2950 is basically the same as in the
     old export Uniden Grant--which isn't a helluva
```

lot different than a standard Grant. The CPU
section can be sensitive, but they've improved
that over time too. The latest generation
(serial numbers above 440000) are alot less
parts dense than the earlier ones. That adds
up to greater reliability.

I just don't have a problem with them. It takes
all kinds out here. There is no one, unarguable
truth out here. Thinking there is will just
lead to arguments.

> If you want channels the hr 2510 last longer(uniden).

I had a Lincoln when I discovered the 2950.
I couldn't get rid of the Lincoln quick enough.
I think the 2510 and it's clones are crude
radios. They especially suck when it comes to
AM modulation.

> By the way i run a
> uniden GRANT XL and a nice Washington with most of advantages of the exports
> ,which will out live your fine 2950.

In your opinion.

Grants and Washingtons are 20+ year old designs
that are barely any more advanced than the 76.

Simple radios for simple people.

> Take care Bill. Just my two cents .

73.

```

Does anyone know the correct soldering sequence for the 4 pin connector microphone (astatic) that will be attached to a Uniden CB. I need to know what color wires go to what pins. Its been a while...........well quite a while since I did my last one...

Thanks in advance !
Dan

Yes, their is.

The baseplate is nearly 10 inches in diameter, so it holds up a multi-pound antenna well.

The quick disconnect is made of Brass plumbing fittings and custom shaft pieces to accomodate the large diameter antennas so you don't end up stripping them out or flexing the bottom of your antenna.

They are built for the big antennas prevelant today. I like them, and Troy guarantees everything he sells.

Be prepared to drop 50 or so dollars on one, though.... I have owned other mounts, and one destroyed my antennas. If Troys mount does that, he buys you an antenna.

Yeah, OK.

How are you going to hear my on the bowl (and quite a lot of people on the newsgroup have, and I have talked to them) when you never listen..

You have said in the past that you don't listen to the bowl, and would NEVER operate their.

Seems to me that you are an agitator, and an asshole.

But, we tolerate you. ;-0

Toll,
 As I remember it, there were a few "hearing" problems with the judges at
Memphis last year that should be fixed this year or it might be the last
year for Memphis holding a decent break.
Train

All equipment in working order unless noted:

1 HR-2510 10,11 and 12 meter radio with Chipswitch and Channel Guard installed. Comes with radio and Chipswitch manuals, Turner +2 Handheld preamp mic, stock mic and mounting bracket.
$200 buyer pays shipping.

1 HR-2510 10 and 11 meter radio with stock mic, Astatic preamp mic (never tested, condition unknown) and mounting bracket. Recently tuned and peaked. The radio has 2 small holes in the top cover where a frequency counter was installed $150 buyers pays shipping.

1 Johnson Challenger 6-80 meter Transmitter with tubes and Johnson Model 122 VFO. Faceplate of radio looks great however the case needs painting. This radio was working when originally boxed. $150 buyer pays shipping.

1 Johnson Transceiver Tester. Comes with original box and Manual. Has Modulation, SWR, RF signal strength, Crystal tester, Audio and Signal generator. 5' Telescoping antenna. $50 buyer pays shipping

1 Yaesu FT-840 HF AM, FM, SSB and CW Tranceiver. Has MARS/CAP mod. Excellent condition. Comes with Stock mic, manuals and original box. 1 owner. Has CW, AM and FM filter boards installed. $495 buyer pays shipping.

2 Cobra HX-35WX 40 Channel CB Walkie Talkies with Weather channels and Accessory Telescoping antennas along with the "Rubber Duck" antennas. 1 owner. I bought these to use these on camping trips. Have boxes and manuals. $60 buyer pays shipping.

1 Yaesu FT-901DM HF AM, FM, SSB and CW Tranceiver in mint condition with FTV-250 2 meter transverter, SP-901P External Speaker/Phone patch and Stock handheld mic. Transverter still has plastic "shrink wrap" on the faceplate. Have all original boxes and Manuals. $495 buyer pays shipping.

1 MFJ-1278 Multi-mode TNC Faceplate is fine but case paint is chipped off in a couple of spots. Have original box and manual. $50 buyer pays shipping.

1 KDK FM-2015R 2 meter mobile with stock mic. Looks and works great. Have

original box and manual. $75 buyer pays shipping.

1 Astatic Stock D-104. Condition unknown. $25 buyer pays shipping.

1 Preamp Astatic Silver Eagle Mic. I bought it used but I never used it. Has 3 position switch on the bottom base for "ETS", "PAD", and "VOX". $50 buyer pays shipping.

1 Shure 526-T preamp mic. Works fine. Presently wired for a Yaesu FT-840 (above). Have manual. $40 buyer pays shipping.

1 Micronda (Radio Shack) SWR/Field Strength meter. No small field strength antenna on top. $12 buyer pays shipping.

1 CD-44 "Ham II" style Rotor and Controller with Compass position readout. Its been packed for some time so the condition is unknown. Cosmetically good. Have manual. $130 buyer pays shipping.

1 P-103 Military Dynamotor. Can produce up to 500 volts @ .16ma with 6 or 12 volt input. Originally used in Military aircraft for radio and electronic amplifiers. I bought it to run an 807 or 811 bottle in a mobile application for nostalgia purposes. Very heavy unit. $50 buyer pays shipping.

1 Homebrew 10 meter tube crystal transmitter with a Hiesing 120v power transformer in it. Unknown condition. $20. Buyer pays shipping

Below are some "Off topic" items for sale:

1 1970 Ford Torino "GT" Convertible with a 300hp 351ci Cleveland. 4bbl carb. Automatic. Black on Black on Black with original Ford "GT" side racing stripes. Body is in good shape. Needs new paint, top, and certain interior items. Strong original motor with 85K ORIGINAL miles on it (does not blow oil). Completely stock. $4200 Can provide *.bmp pictures via email.

1 Gibson Les Paul "The Paul" guitar with case. Natural finish. I bought it in the mid 1970's. Low action with no buzzing. Has Lawrence "Twin Rail" pickups. Ebony fretboard. $400 buyer pays shipping.

1 1977 MGB Convertible project car. All body work professionally done and the car is completely in primer. Entire car must be re-assembled. $4800 invested and I dont have time to finish. Make reasonable offer (Wife is torturing me to get it out of the garage and I cant hold her off any longer).

1 1967 Camaro SS/RS Convertible in next to Mint condition. Only 950 manufactured. 51K ORIGINAL miles. White paint with Orange racing hood stripes. White top, White Interior and Black rugs/dash. Hi-perf 327ci w/Ramheads. Quadrajet 4bbl and Muncie Stone Crusher 4 speed. 3:73 12 bolt posi rear. Has Factory GM Air shocks with GM auto fill compressor in trunk which is controlled from the dashboard. This car is show quality. All original. Have original window sticker, manual and the "Red-line" spare tire has never been used. Can provide *.bmp photos via email. $25,000.

It's a TV thing...Old and crude, with poor resolution. If only I could
afford a new one...

>better quality antenna is a good investment. A good antenna can help make a
>cheap radio good

Correct. Also important to note that the opposite is NOT true. A poor, cheap
antenna cannot make any radio perform well. Thus, a Cobra 19 Plus with a
Wilson 1000 will outperform a 148-F with a Popular Mechanics mag mount from
Wal-Mart.

If you're on a limited budget, put your money into the antenna first.

Bill,

"A strong carrier with a low percent
of modulation may give a weaker response
in a receiver than a weaker carrier with
a greater percent of modulation"

"Because the percent of modulation is
directly related to the loudness and
intelligibility of the signal produced
in a receiver, the higher the percent
of modulation that can be maintained
without producing distortion, the more
effective the communications can be".

Robert L. Shrader
Former Chairman of Electronics,
Laney College
McGraw Hill, 4th Edition,
Electronic Communication........
(1980, 1975, 1967, 1959)

I don't know why you insist on arguing
and wanting everyone to prove something
when this has been common knowledge in
the public domain for almost 5 decades now!

Tell me Bill, which part of this DON'T
YOU UNDERSTAND?

Jack

http://www.angelfire.com/az/firecommunications/

"Do it right the first time or
don't bother doing it at all"!

This is a legitimate site. It has a lot of real good info on it. If
you look at the entire note you'll see that the call letters are for a
"Rgestered Scanner". Not a ham or other radio operator. Lot of
mititary info at this site seeing that the operator is near NFAF base.

I never said that they were the best antenna. I run them on my vehicle because they work. To me they are the best. I have tried the others. I have not tried the monkey made. I do know that the predator 10k is the lightest antenna and the whole antenna is machined, nothing pressed. I also like the fact that the guy who builds these antennas will cover the antenna warranty. and this I can personally attest to, and I dont mean waiting for weeks to get your antenna back. I run a long antenna on the back of my vehicle and a short one on the front, I have smacked a couple of trees with the back one and the guy fixed them without any problems whatsoever. P.S. I also like the 55's they also work really well. they are built on the same concept (Machined) aluminum, but they are then welded and they use a flat material for the load coil and will handle more power, but they also cost more. and

```
dont buy that antenna (102) at cb city, that is a heavy, pressed,plated
piece of junk. spend your money on something handmade.

Chris wrote in message <7805-37EEAFA8-79@newsd-212.iap.bryant.webtv.net>...
The antenna that is advertised is an Xterminator 2. Its distributed and
sold under a lot of different names.

A grapefruit will work and give you a little higher voltage but the electrodes will deteriorate quickly and you won't get the same power (amps) out of it.

10 ohm smoke,

"Why not? Do you not realize
that correct speaking is also
a sign of correct thinking"?

"Well, it is"!

Jack

OK OK lets not resort to
misspelled words to try
and prove that someone is
not so "smart"!

"It's true! BTW, the
point was not brought up
with any reference to
"smarts", those are your
words, not mine"!

(my words below)

Poor Toll Free got so shook up
that he forgot how to spell! (busshlit)
believe me, resorting to these tasteless
tactics while trying to defend your somewhat
questionable points of view does nothing to
lend any credibility to you or your tireless
mission of continual "misinformation"!

"Nothing in the above refers
to either smarts or intelligence!
I believe that loss of self
composure was the topic here"!

Hey All,

Do any of you know of any mods to convert my CB to the 10 meter band? I have an old I think '84 model 23 channel Royce CB along with an Royce Base station 23 channel CB. Any one who knows anything about it please email me a reply.

Thanks guys,

```

hey tool free ,don't worry about rush limbaugh, i the great pinhead , am among other things a ditto head and i do not appreciate your absurd attempts at belittling the great one. i think it would be funny as hell , if rush was allowed to broadcast , on your precious channel 6 . maybe all those crybaby democrats, who think that somebody else is supposed to take care of them, while they spend the day talking on a silly cb radio, would perhaps learn something , which i myself , doubt very seriously. it would be entertaining , at the very least , no doubt. of course , they would not understand , tough love...........................head out and standing by.............

thanks alot

Jack Thurston <fire228@cybertrails.com> wrote in message
news:37EF343E.3770@cybertrails.com...
Rollo_ver,

I saw the response to your question
about the missing frequencies from
27.415 - 27.445......................

look on the pc board between the rear
of the front face and the 8719.........
On the board you should see a couple of
short bare jumper wires side by side...
When one of these jumpers is removed the
frequencies in question will appear in
the radio........I forget whether this
displaces any pre-existing channels from
the standard mod, but a switch at the
active jumper will take care of this
quite nicely..........................

Hope this helps........Let me know!

Jack

White trailer trash is too nice and quite generous--better to find out where he lives and if it is close, move away, or move him away. His comment is inappropriate here and anywhere else. An onlooker might perceive that ALL cbers share that ignorant, bigotted opinion which certainly is not the case.

Beedman007 wrote:

The PC68XL would be out of the question for me because it has only 1 mode,AM.If it had only SSB I could live with it.The PC122 works good as long as some idiot doesn't try and freq. it but I would save a little longer for the Grant and realize it may be the best mobile CB available.

Hello & Good afternoon Jay,
All Bullshit aside (Mainly Pinheads), That look almost like
the old Saturn 5 antenna from the 70's. I wonder if Avanti
just remade it ? Inquiring minds wan to know......

The Landshark

You gotta change all the crystals to cover the ten meter band.

Crystals cost about 7-10 dollars each, save your time and
trouble...buy a 10 meter rig thats current!

BTW...23 channel radios were discontinued after 1977(1976) due to the
new 40 channels units!

Believe it or not I agree with you 100%. We have found that the 102 that we sell in the pre-packaged has turned out to be a flop. It does not hold together and the little plastic insulator that they put in them have a habit of breaking.

We of all people have to try new things as they hit the market. Sometimes they are winners, sometimes they are losers, but without someone trying them and giving us a report on their performance, we are in the dark.
We do no claim that all of our products are the top of the line, because not everyone can afford the pricy "hand-made" items, as no one can. All we can do is offer our honesty in admitting so.

10 OHM SMOKE wrote:

> I never said that they were the best antenna. I run them on my vehicle because they work. To me they are the best. I have tried the others. I have not tried the monkey made. I do know that the predator 10k is the lightest antenna and the whole antenna is machined, nothing pressed. I also like the fact that the guy who builds these antennas will cover the antenna warranty. and this I can personally attest to, and I dont mean waiting for weeks to get your antenna back. I run a long antenna on the back of my vehicle and a short one on the front, I have smacked a couple of trees with the back one and the guy fixed them without any problems whatsoever. P.S. I also like the 55's they also work really well. they are built on the same concept (Machined) aluminum, but they are then welded and they use a flat material for the load coil and will handle more power, but they also cost more. and dont buy that antenna (102) at cb city, that is a heavy, pressed,plated piece of junk. spend your money on something handmade.

I took my RS TRC-485 AM/SSB out of my car and put in a Uniden PRO 640e AM/SSB that I got off of eBay and an Astatic 575. The 640e was never used and is in new condition, it was still in the plastic wrapper!!! I did turn the ALC pot all the way up and the AMC pot all the way down though. The power out of the radio is 4 watt, RMS, on AM. The question that I have is, whats the proper way to set this radio up to run an amp? Should I have it peaked by the local shop or leave the power stock with the mod limiter in tact? The amp and antenna setup that I will be using with the Uniden is a Silver Eagle 200 and an X-terminator II. Thanks

And I supposed, old fart that ye are, you have never heard of a typo on a keyboard, right?

I would lay 1,000 to one odds that if you look at my posts in the past, I will have less typos and misspelled words than most anyone on this newsgroup.

So, once again, Jack, you are an idiotic amateur technician that really has no idea what he is talking about.

I have been here since Bill Eitner professed the same BS that you are now... The difference is that he (as well as the Professor, to an extent) was willing to do some experiments, and learned a great deal. Now, he is one that will take the time to attempt to educate an idiot such as yourself.

It is a pity that you are so quick to "mimic" something that "has been known for 50 years", but then you are so quick to even open your own mind to something that has been discovered.... Either for the first time, or discovered anew!

So, let;s look at how far the panties of yourn got stuck in the crack of your arse! Please, Jack, see below:

>   "Why not? Do you not realize
> that correct speaking is also
> a sign of correct thinking"?
>

Ahh.... But, oh he who loves to take everything out of context to attempt to prove a point that has nothing to do with the current discussion, I was not speaking..... I was typing!

And it seems to me that you got the point, even if the word was misspelled.

Does that mean that you got those panties up so far that you forgot the difference between the written word and the spoken word? Do you know the difference between verbal interaction with another human and the spoken word?

If not, I think we have another case in point for dropping the CW rules! Speach and typing are two entirely different mediums of conversation!

>   "Well, it is"!
>

No, Jack, it is only a feeble attempt at your trying to discredit someone. That was proven above, where I had to show you that typing and speech are two different things.

>   Jack
>
> OK OK lets not resort to
> misspelled words to try
> and prove that someone is
> not so "smart"!
>
> "It's true!

Is it true that when a person is typing on a laptop keyboard for the first couple days that when they make a typo it means that they are any less intelligent?

And if you are attempting to say that someone is not smart, then when someone calls you on it you rebuff your statement, then say it all over again....... Well, let's just say that the old shrink may still need a couple more sessions with you..

Roses are red
Violets are blue.
Jacks schizophrenic and so is Jack...

My, my, my... Jack can't even remember what he is talking about! Isn't that sad? They say the mind is the first to go!

BTW, the
> point was not brought up
> with any reference to
> "smarts", those are your
> words, not mine"!
>

But, you just said that it was true! So, if that is what you meant, why are you attempting to bag on another person for calling a spade a spade? I mean really now!

>   (my words below)
>
>   Poor Toll Free got so shook up
> that he forgot how to spell! (busshlit)
> believe me, resorting to these tasteless

Wait!!! You have got to love this one! Jack was so happy that he finally caught me in something that he could REALLY prove that he forgot the simple are of punctuation as well as capitalization! When you are going to quote, you would need quotes (these are quotes, for your future reference ".. You put them at the beginning and end of the quoted passage or word(s)) around the word "busshlit" and would need to capitalize the beginning of the next word, since it starts a new sentence!

Guess that means that you forgot correct grammer too, huh Jack! Now, who is the person in the wrong! I typo'ed a word... You forgot correct grammer, punctuation as well as capitalization!

Stop crying and get those panties out of the crack! I didn't mean to shake you up so bad!

> tactics while trying to defend your somewhat
> questionable points of view does nothing to
> lend any credibility to you or your tireless
> mission of continual "misinformation"!

Please quote where I have posted misinformation. Anything that I post has been backed up either by textbook example, my own experimentation or that of others. You are the one that is spreading "continual 'misinformation' ", and it has been proven by the people on this newsgroup respected by others.

>
> "Nothing in the above refers
> to either smarts or intelligence!

No, I seem to recall above that you said it did... I will quote for you, since it seems that you forget so easily (that old age thing again, I am sure...)

"OK OK lets not resort to
misspelled words to try
and prove that someone is
not so "smart"!

"It's true! BTW, the
point was not brought up
with any reference to
"smarts", those are your
words, not mine"!

So, Jack again has contradicted himself.

Nice try, Jack, but it just doesn't jive...

Your wrong.... again.... Please go quietly to the corner and lick your wounds. We won't be mad when you come back out. If you play nicely, people will respect you.

Play like you are now, and people will continue to run you down... And you make it so easy just because all we have to do is repost what you have written (not spoken... Typed or written would be the correct terminology here!!!) and it is proven for us!

Have a good day....

And remember... "Hooked on Phonics" isn't that expensive...

Toll Free

Actually, due to what is called "skin effect" the radio waves only travel along the very outside of the conductor. They would not even touch the copper core. The actual problem is in the formula you are using. The one you are using is for 1/2 of a 1/2 wave dipole with a length to diameter ratio of approximately 10,000 and additonal "loading" from the end effect of of

```
insulators.  In practice, the "electrical" length of any antenna is shorter
than its "actual" length because the velocity of an electromagnetic wave is
slower through a wire than through space. Many factors influence the actual
length needed to produce a resonant electrical length. Equations are good,
but they cannot be solely relied on. In any practical case an antenna must
be pruned to resonance.

Hello Landshark: Yes it is a Avanti AV-190 "Saturn", I don't know about the Saturn 5 part. One rule of thumb ya might half to accept here, is that the antenna may have had a few different names, there was so much CB stuff sold in the CB Boom of the 70's, I'll bet no one knows for sure who sold what. But the antenna manufactures did stop manufacturing a lot of antennas around 1978, 1978, & 1979, as the sun spot cycle pooped out, or skip conditions, along with the CB Boom/Craze market.

I don't remember for sure what these Saturn antennas where called. One of the locals had one, but mounted it only a few feet from the ground. And it didn't do well, I credit this with the poor installation. I tried to suggest a higher installation, but was told to but out. "Ten-4", I said.

I would think this antenna needs to be installed pretty high so that the horizontal ground radials have a chance to work.

No Avanti did not just remake it. The folks here who put up the neat web site found the antenna in its original installation since 1976, I believe. A class 1 install I would say.

The guy who bought out Avanti, and can sell parts and pieces, or the hole antenna is:
H.C. Van Valzah
38W111 Horse Shoe Dr.
Vatavia IL 60510
Phone 630-406-9210

Tellem Jay sent ya.

For a Free assembly instruction sheet, for the Sigma 5/8 AV-170, or the Saturn AV-190 shown in the web site of this tread, contact:
Allen Telecom Inc.
Antenna Specialists Div.
Parkway Cleveland Ohio
44139-3996
Phone 440-349-8677 or at:
http://www.allentele.com/antenna/products.html

If ya tellem Jay sent ya, they'll water down your drinks and charge ya double!

The Sigma 5/8, Saturn, Penetrator 500, CLR-2, and many other antennas where stopped manufactured after the 70's CB Boom, and skip cycle. Also the cost of aluminum tubing has sky rocketed in price. Bill at Bills 2 way radio, told me, he sold me his last MaCo V58, and that the fiberglass antennas where selling 10 to 1 of the aluminum MaCo V58 antenna. This was in Feb. of this year. I hope where not seeing the last of the MaCo V58.

Jay in the Mojave

The problem with running caps is that they are EXPENSIVE!!!!

For the gentleman that had a pair, it would hurt nothing (and I will get into this later, as this is a qualified statement!!!) to add the caps...

However, if you are not overcharging your electric system (running 19 volts on a pair of golf cart batteries!), a cap does not do much good at all. Sure, it will filter out the <<slight>> bit of ripple present on the rectified DC, but if you have enough battery reserve, this will be done at that level, anyway.

The other thing to watch out for with caps is the AC RF component on the DC lines.... It is not uncommon to see many volts (sometimes nearly a hundredin the case of a large amplifier) on the DC lines. If you are running a 35 VDC cap, what happens....? Crackle!! Fizz Fizz.... Your car fills with a putrecent smoke, your car stinks, and you buy more caps... Most people are going to run a car audio capacitor, and that makes for low voltage ratings... On the order of 25 to 35 VDC... Exceed this rating, and poof..... Problem city!

If you are going to run a mammoth alternator, and an external rectifier, then yes, you can go with a complete capacitor system.... Their is an inherent problem in doing this, too...

1. Not many people know how to hook up a 3 phase AC to DC rectifier...
2. Their is a voltage "overshoot" when you unkey the amplifier. We use the cap / alternator method on some large systems here in Texas, but their is always a problem with the period of time from when the field completely collapses in the alternator and the time the amp unkeys... The current draw of the amplifier dies off, and then the voltage overshoots the threshold set by the regulator... This has been known to fry 2879s before.

The cure... The Dead Motor Maul. That is what we use. For people who don't want to spend the $$$ on the Dead Motor Maul, a couple batteries in parallel to the electric system will work, but the voltage overshoot is still their.

So, for the average Joe to want to run caps... It can be done, but rarely, if ever worth the effort. For a competition user, yes, it can be done, but remember, you don't get the luxury of battery reserve... And that battery reserve means a lot when you are running anything bigger than 8 transistors! Translate this into Alternators, alternators, ALTERNATORS!!!......... The DC current has to come from somewhere.

Now, on the flip side, to the battery method...

Pick the voltage level that you want to idle at, in 2 volt increments..
1. 14 volt
2. 16 volt
3. 18 volt
4. 20 volt (approximately).

Anything greater than that, and you will be frying transistors.

1. 14 volt system, use a bank of automotive batteries (although I have been trying out a Gell Cell pack... Using batteries for a commercial UPS system, I have outfitted 5 batteries in my Suburban.. at 35% charge, I am able to pull 1100 amps out of them for short bursts (each battery, mind you) at 11 volts. Great for keydown useage!!!). Use the rule of thumb I gave earlier, and this will work.

2. 16 volt system: Use 2 8 volt batteries. They make a golf cart battery, but that is not the best. Their is also a 8 volt battery that the old Model T era cars used. It is a good battery, but not very good at high charge / discharge rates... Fails earlier than other battery types. The best 8 volt batteries that I have found are the ones that are classified as a "Tug Bat" battery. They are prevelant here in Houston (international shipping port), are rebuilt due to the demand from ships, and hold a HUGE amount of current. Also, they seem to take being abused better than any other battery I have seen. I highly recommend them for 8 volt useage.

3. 18 volts system: Run 3X6 volt batteries in series. A combination of deep cycle and "normal" automotive work good... 3X deep cycle, in parallel with 3X automotive. The deep cycle will store a charge capable of quick charging the automotive batteries, which have the fast response time needed for quick keyups. Puts less of a strain on the alternator, as the deep cycle batteries seem to pull a little less current all at once.

4. 20 volt system: Run a automotive type battery and a 8 volt battery (although a 6 volt batterty will work, if you want to have a "soft" 20 volts. It will sag to about 18 volts under key, providing a safety margin). This is for the diehards, as it puts the most strain on the alternator and amplifier.

With a 16 volt system, you are the most versatile. I have run a 16 volt system and found that I could ru nit from 14 volts (charge the system at 16 volts, and under load, it will drop to app 14 volts) all the way up to 18 volts (and a little more, when the engine was revved up). You can keep the system charging at app 17 volts, or lower if you don't have an amp that will handle it), and when you upgrade, you are prepared to volt to 18 or more volts.

With caps you can do the same, but only to about 70 percent of the rated voltage of the cap.... And, if you have shitty bypass methods in the amplifier (read that as any of the mass produced "Battle Box" types of amps), you can and I have blown out the caps from RF being on the line.

Hope this long ass message helps someone.

Yes, but a 2KW pep station operating on AM will only produce 500 or less AVG watts!

Oh really? If his radio is a 1984 model then it is a 40 channel PLL.
I have done many Uniden chassis by simply changing the loop mixing
crystal and retune the radio. It doesn't have all the power on transmit
or sensitivity on receive that it did as a stock cb, but it's more than
adequate. The biggest problem is finding the right crystal at a good
price. I have a Montgomery Ward 719 that I converted recently and
it works great. Piece of Cake.

MENLO PARK, CA: The FCC sent a Warning Notice August 18, 1999, to Technician licensee William A. Eitner, KD6TAS, citing information before the Commission alleging that, as recently as July 25, 1999, the licensee was deliberately and maliciously interfering with K7IJ repeater operations in his area. FCC Legal Adviser for Enforcement Riley Hollingsworth reminded the licensee that such operation is contrary to the basis and purpose of Amateur Radio, degrades the service for legitimate users and cannot be tolerated. Hollingsworth requested that the licensee contact him to discuss the matter.

   there are a pretty good antenna the thing to do with that one is to =
make that every joint is sealed with silicon real well and you should =
have no problems with at all make sure you have a good match first =
though=20
